23.1. **Identify:** Apply Eq. (23.2) to calculate the work. The electric potential energy of a pair of point charges is given by Eq. (23.9).

**Set Up:** Let the initial position of $q_2$ be point $a$ and the final position be point $b$, as shown in Figure 23.1.

![Figure 23.1](image)

$r_a = 0.150 \text{ m}$

$r_b = \sqrt{(0.250 \text{ m})^2 + (0.250 \text{ m})^2}$

$r_b = 0.3536 \text{ m}$

**Execute:**

$W_{a\rightarrow b} = U_a - U_b$

$U_a = \frac{1}{4\pi\varepsilon_0} \frac{q_1q_2}{r_a} = (8.988 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \frac{(+2.40 \times 10^{-6} \text{ C})(-4.30 \times 10^{-6} \text{ C})}{0.150 \text{ m}}$

$U_a = -0.6184 \text{ J}$

$U_b = \frac{1}{4\pi\varepsilon_0} \frac{q_1q_2}{r_b} = (8.988 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \frac{(+2.40 \times 10^{-6} \text{ C})(-4.30 \times 10^{-6} \text{ C})}{0.3536 \text{ m}}$

$U_b = -0.2623 \text{ J}$

$W_{a\rightarrow b} = U_a - U_b = -0.6184 \text{ J} - (-0.2623 \text{ J}) = -0.356 \text{ J}$

**Evaluate:** The attractive force on $q_2$ is toward the origin, so it does negative work on $q_2$ when $q_2$ moves to larger $r$.

23.2. **Identify:** Apply $W_{a\rightarrow b} = U_a - U_b$.

**Set Up:** $U_a = +5.4 \times 10^{-8} \text{ J}$. Solve for $U_b$.

**Execute:**

$W_{a\rightarrow b} = -1.9 \times 10^{-8} \text{ J} = U_a - U_b$, $U_b = U_a - W_{a\rightarrow b} = +5.4 \times 10^{-8} \text{ J} - (-1.9 \times 10^{-8} \text{ J}) = 7.3 \times 10^{-8} \text{ J}$

**Evaluate:** When the electric force does negative work the electrical potential energy increases.

23.3. **Identify:** The total potential energy is the scalar sum of all the individual potential energies of the protons in the nucleus, relative to infinity.

**Set Up:** The total potential energy is the scalar sum of all the individual potential energies, where each potential energy is $U = (1/4\pi\varepsilon_0)(q_0/e^2/r)$. Each charge is $e$ and the charges are equidistant from each other, so the total potential energy is

$U = \frac{1}{4\pi\varepsilon_0} \left( \frac{e^2}{r} + \frac{e^2}{r} + \frac{e^2}{r} \right) = \frac{3e^2}{4\pi\varepsilon_0 r}$
EXECUTE: Adding the potential energies gives
\[ U = \frac{3e^2}{4\pi\varepsilon_0 r} = \frac{3(1.60\times10^{-19} \text{ C}^2)(9.00\times10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)}{2.00\times10^{-15} \text{ m}} = 3.46\times10^{-13} \text{ J} = 2.16 \text{ MeV} \]

EVALUATE: This is a small amount of energy on a macroscopic scale, but on the scale of atoms, 2 MeV is quite a lot of energy.

23.4. IDENTIFY: The work required is the change in electrical potential energy. The protons gain speed after being released because their potential energy is converted into kinetic energy.
(a) SET UP: Using the potential energy of a pair of point charges relative to infinity, \[ U = \frac{1}{4\pi\varepsilon_0}(q_0/q_1/r), \]
we have \[ W = \Delta U = U_2 - U_1 = \frac{1}{4\pi\varepsilon_0} \left( \frac{e^2}{r_2} - \frac{e^2}{r_1} \right). \]

EXECUTE: Factoring out the \( e^2 \) and substituting numbers gives
\[ W = (9.00\times10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(1.60\times10^{-19} \text{ C})^2 \left( \frac{1}{3.00\times10^{-15} \text{ m}} - \frac{1}{2.00\times10^{-10} \text{ m}} \right) = 7.68\times10^{-14} \text{ J} \]
(b) SET UP: The protons have equal momentum, and since they have equal masses, they will have equal speeds and hence equal kinetic energy. \( \Delta U = K_1 + K_2 = 2K = 2\left(\frac{1}{2}mv^2\right) = mv^2. \)

EXECUTE: Solving for \( v \) gives \( v = \sqrt{\frac{\Delta U}{m}} = \frac{\sqrt{7.68\times10^{-14} \text{ J}}}{1.67\times10^{-27} \text{ kg}} = 6.78\times10^6 \text{ m/s}. \)

EVALUATE: The potential energy may seem small (compared to macroscopic energies), but it is enough to give each proton a speed of nearly 7 million m/s.

23.5. (a) IDENTIFY: Use conservation of energy:
\[ K_a + U_a + W_{\text{other}} = K_b + U_b \]
\( U \) for the pair of point charges is given by Eq. (23.9).

SET UP:
\[ v_a = 22.0 \text{ m/s} \]
\[ v_b = ? \]
\[ r_a = 0.800 \text{ m} \]
\[ r_b = 0.400 \text{ m} \]

Figure 23.5a

EXECUTE: Only the electric force does work, so \( W_{\text{other}} = 0 \) and \( U = \frac{1}{4\pi\varepsilon_0} \frac{q_1q_2}{r}. \)
\[ K_a = \frac{1}{2}mv_a^2 = \frac{1}{2}(1.50\times10^{-3} \text{ kg})(22.0 \text{ m/s})^2 = 0.3630 \text{ J} \]
\[ U_a = \frac{1}{4\pi\varepsilon_0} \frac{q_1q_2}{r_a} = (8.988\times10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)\left(\frac{-2.80\times10^{-6} \text{ C}\times-7.80\times10^{-6} \text{ C}}{0.800 \text{ m}} \right) = +0.2454 \text{ J} \]
\[ K_b = \frac{1}{2}mv_b^2 \]
\[ U_b = \frac{1}{4\pi\varepsilon_0} \frac{q_1q_2}{r_b} = (8.988\times10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)\left(\frac{-2.80\times10^{-6} \text{ C}\times-7.80\times10^{-6} \text{ C}}{0.400 \text{ m}} \right) = +0.4907 \text{ J} \]
The conservation of energy equation then gives \( K_b = K_a + (U_a - U_b) \)

\[ \frac{1}{2} m v_b^2 = +0.3630 \, J + (0.2454 \, J - 0.4907 \, J) = 0.1177 \, J \]

\[ v_b = \sqrt{\frac{2(0.1177 \, J)}{1.50 \times 10^{-3} \, \text{kg}}} = 12.5 \, \text{m/s} \]

**Evaluate:** The potential energy increases when the two positively charged spheres get closer together, so the kinetic energy and speed decrease.

**(b) Identify:** Let point \( c \) be where \( q_2 \) has its speed momentarily reduced to zero. Apply conservation of energy to points \( a \) and \( c \): \( K_a + U_a + W_{\text{other}} = K_c + U_c \).

**Set Up:** Points \( a \) and \( c \) are shown in Figure 23.5b.

**Execute:**

\( K_a = +0.3630 \, J \) (from part (a))

\( U_a = +0.2454 \, J \) (from part (a))

\[ r_a = 0.800 \, \text{m} \]

**Figure 23.5b**

\( K_c = 0 \) (at distance of closest approach the speed is zero)

\[ U_c = \frac{1}{4\pi\varepsilon_0} \frac{q_1 q_2}{r_c} \]

Thus conservation of energy \( K_a + U_a = U_c \) gives

\[ \frac{1}{4\pi\varepsilon_0} \frac{q_1 q_2}{r_c} = +0.3630 \, J + 0.2454 \, J = 0.6084 \, J \]

\[ r_c = \frac{1}{4\pi\varepsilon_0} \frac{q_1 q_2}{0.6084 \, J} = (8.988 \times 10^9 \, \text{N} \cdot \text{m}^2/\text{C}^2) \frac{-2.80 \times 10^{-6} \, \text{C} \cdot -7.80 \times 10^{-6} \, \text{C}}{0.6084 \, J} = 0.323 \, \text{m} \]

**Evaluate:** \( U \to \infty \) as \( r \to 0 \) so \( q_2 \) will stop no matter what its initial speed is.

**23.6. Identify:** The total potential energy is the scalar sum of the individual potential energies of each pair of charges.

**Set Up:** For a pair of point charges the electrical potential energy is \( U = k \frac{q_1 q_2}{r} \). In the O-H-N combination the O\(^-\) is 0.170 nm from the H\(^+\) and 0.280 nm from the N\(^-\). In the N-H-N combination the N\(^-\) is 0.190 nm from the H\(^+\) and 0.300 nm from the other N\(^-\). \( U \) is positive for like charges and negative for unlike charges.

**Execute:**

**(a) O-H-N:**

\[ \text{O}^- - \text{H}^+: U = -(8.99 \times 10^9 \, \text{N} \cdot \text{m}^2/\text{C}^2) \frac{(1.60 \times 10^{-19} \, \text{C})^2}{0.170 \times 10^{-9} \, \text{m}} = -1.35 \times 10^{-18} \, \text{J} \]

\[ \text{O}^- - \text{N}^-: U = (8.99 \times 10^9 \, \text{N} \cdot \text{m}^2/\text{C}^2) \frac{(1.60 \times 10^{-19} \, \text{C})^2}{0.280 \times 10^{-9} \, \text{m}} = +8.22 \times 10^{-19} \, \text{J} \]

**(N-H-N):**

\[ \text{N}^- - \text{H}^+: U = -(8.99 \times 10^9 \, \text{N} \cdot \text{m}^2/\text{C}^2) \frac{(1.60 \times 10^{-19} \, \text{C})^2}{0.190 \times 10^{-9} \, \text{m}} = -1.21 \times 10^{-18} \, \text{J} \]

\[ \text{N}^- - \text{N}^-: U = (8.99 \times 10^9 \, \text{N} \cdot \text{m}^2/\text{C}^2) \frac{(1.60 \times 10^{-19} \, \text{C})^2}{0.300 \times 10^{-9} \, \text{m}} = +7.67 \times 10^{-19} \, \text{J} \]
The total potential energy is
\[ U_{\text{tot}} = -1.35 \times 10^{-18} \text{ J} + 8.22 \times 10^{-19} \text{ J} - 1.21 \times 10^{-18} \text{ J} + 7.67 \times 10^{-19} \text{ J} = -9.71 \times 10^{-19} \text{ J}. \]
\[ \text{(b) In the hydrogen atom the electron is 0.0529 nm from the proton.} \]
\[ U = -(8.99 \times 10^9 \text{ N \cdot m}^2/\text{C}^2) \frac{(1.60 \times 10^{-19} \text{ C})^2}{0.0529 \times 10^{-9} \text{ m}} = -4.35 \times 10^{-18} \text{ J}. \]

**EVALUATE:** The magnitude of the potential energy in the hydrogen atom is about a factor of 4 larger than what it is for the adenine-thymine bond.

### 23.7. IDENTIFY:
The total potential energy is the scalar sum of the individual potential energies of each pair of charges.

**SET UP:** For a pair of point charges the electrical potential energy is \( U = k \frac{q_1 q_2}{r} \). In the O-H-O combination the \( O^- \) is 0.180 nm from the \( H^+ \) and 0.290 nm from the other \( O^- \). In the N-H-N combination the \( N^- \) is 0.190 nm from the \( H^+ \) and 0.300 nm from the other \( N^- \). In the O-H-N combination the \( O^- \) is 0.180 nm from the \( H^+ \) and 0.290 nm from the \( N^- \). \( U \) is positive for like charges and negative for unlike charges.

**EXECUTE:**
- O-H-O \( O^- - H^+ \), \( U = -1.28 \times 10^{-18} \text{ J} \); \( O^- - O^- \), \( U = +7.93 \times 10^{-19} \text{ J} \).
- N-H-N \( N^- - H^+ \), \( U = -1.21 \times 10^{-18} \text{ J} \); \( N^- - N^- \), \( U = +7.67 \times 10^{-19} \text{ J} \).
- O-H-N \( O^- - H^+ \), \( U = -1.28 \times 10^{-18} \text{ J} \); \( O^- - N^- \), \( U = +7.93 \times 10^{-19} \text{ J} \).

The total potential energy is \( -3.77 \times 10^{-18} \text{ J} + 2.35 \times 10^{-18} \text{ J} = -1.42 \times 10^{-18} \text{ J} \).

**EVALUATE:** For pairs of opposite sign the potential energy is negative and for pairs of the same sign the potential energy is positive. The net electrical potential energy is the algebraic sum of the potential energy of each pair.

### 23.8. IDENTIFY:
Call the three charges 1, 2 and 3. \( U = U_{12} + U_{13} + U_{23} \)

**SET UP:** \( U_{12} = U_{23} = U_{13} \) because the charges are equal and each pair of charges has the same separation, 0.500 m.

**EXECUTE:**
\[ U = \frac{3kq^2}{0.500 \text{ m}} = \frac{3k(1.2 \times 10^{-6} \text{ C})^2}{0.500 \text{ m}} = 0.078 \text{ J}. \]

**EVALUATE:** When the three charges are brought in from infinity to the corners of the triangle, the repulsive electrical forces between each pair of charges do negative work and electrical potential energy is stored.

### 23.9. IDENTIFY:
The protons repel each other and therefore accelerate away from one another. As they get farther and farther away, their kinetic energy gets greater and greater but their acceleration keeps decreasing. Conservation of energy and Newton’s laws apply to these protons.

**SET UP:** Let \( a \) be the point when they are 0.750 nm apart and \( b \) be the point when they are very far apart. A proton has charge +e and mass 1.67 \times 10^{-27} \text{ kg}. As they move apart the protons have equal kinetic energies and speeds. Their potential energy is \( U = ke^2/r \) and \( K = \frac{1}{2} mv^2 \). \( K_a + U_a = K_b + U_b \).

**EXECUTE:**
- (a) They have maximum speed when they are far apart and all their initial electrical potential energy has been converted to kinetic energy. \( K_a + U_a = K_b + U_b \).
  \( K_a = 0 \) and \( U_b = 0 \), so
  \[ K_b = U_a = k \frac{e^2}{r_0} = (8.99 \times 10^9 \text{ N \cdot m}^2/\text{C}^2) \frac{(1.60 \times 10^{-19} \text{ C})^2}{0.750 \times 10^{-9} \text{ m}} = 3.07 \times 10^{-19} \text{ J}. \]
  \[ K_b = \frac{1}{2} m v_b^2 + \frac{1}{2} m v_a^2, \text{ so } K_b = m v_b^2 \text{ and } v_b = \sqrt{\frac{K_b}{m}} = \sqrt{\frac{3.07 \times 10^{-19}}{1.67 \times 10^{-27} \text{ kg}}} = 1.36 \times 10^4 \text{ m/s}. \]
(b) Their acceleration is largest when the force between them is largest and this occurs at \( r = 0.750 \) nm, when they are closest.

\[
F = k \frac{e^2}{r^2} = (8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \left( \frac{1.60 \times 10^{-19} \text{ C}}{0.750 \times 10^{-9} \text{ m}} \right)^2 = 4.09 \times 10^{-10} \text{ N}.
\]

\[
a = \frac{F}{m} = \frac{4.09 \times 10^{-10} \text{ N}}{1.67 \times 10^{-27} \text{ kg}} = 2.45 \times 10^{17} \text{ m/s}^2.
\]

**Evaluate:** The acceleration of the protons decreases as they move farther apart, but the force between them is repulsive so they continue to increase their speeds and hence their kinetic energies.

### 23.10. Identify

The work done on the alpha particle is equal to the difference in its potential energy when it is moved from the midpoint of the square to the midpoint of one of the sides.

**Set Up:** We apply the formula \( W_{a \rightarrow b} = U_a - U_b \). In this case, \( a \) is the center of the square and \( b \) is the midpoint of one of the sides. Therefore \( W_{\text{center} \rightarrow \text{side}} = U_{\text{center}} - U_{\text{side}} \) is the work done by the Coulomb force.

There are 4 electrons, so the potential energy at the center of the square is 4 times the potential energy of a single alpha-electron pair. At the center of the square, the alpha particle is a distance \( r_1 = \sqrt{50} \text{ nm} \) from each electron. At the midpoint of the side, the alpha is a distance \( r_2 = 5.00 \text{ nm} \) from the two nearest electrons and a distance \( r_3 = \sqrt{125} \text{ nm} \) from the two most distant electrons. Using the formula for the potential energy (relative to infinity) of two point charges, \( U = (1/4\pi\varepsilon_0)(qq/e)/r \), the total work done by the Coulomb force is

\[
W_{\text{center} \rightarrow \text{side}} = U_{\text{center}} - U_{\text{side}} = 4 \frac{1}{4\pi\varepsilon_0} \frac{qq_a}{r_1} - \left( 2 \frac{1}{4\pi\varepsilon_0} \frac{qq_a}{r_2} + \frac{1}{4\pi\varepsilon_0} \frac{qq}{r_3} \right)
\]

Substituting \( q_e = -e \) and \( q_a = 2e \) and simplifying gives

\[
W_{\text{center} \rightarrow \text{side}} = -4e^2 \frac{1}{4\pi\varepsilon_0} \left[ \frac{2}{r_1} - \left( \frac{1}{r_2} + \frac{1}{r_3} \right) \right]
\]

**Execute:** Substituting the numerical values into the equation for the work gives

\[
W = -4(1.60 \times 10^{-19} \text{ C})^2(9.00 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \left[ \frac{2}{\sqrt{50} \text{ nm}} - \left( \frac{1}{5.00 \text{ nm}} + \frac{1}{\sqrt{125} \text{ nm}} \right) \right] = 6.08 \times 10^{-21} \text{ J}
\]

**Evaluate:** Since the work done by the Coulomb force is positive, the system has more potential energy with the alpha particle at the center of the square than it does with it at the midpoint of a side. To move the alpha particle to the midpoint of a side and leave it there at rest an external force must do \(-6.08 \times 10^{-21} \text{ J}\) of work.

### 23.11. Identify

Apply Eq. (23.2). The net work to bring the charges in from infinity is equal to the change in potential energy. The total potential energy is the sum of the potential energies of each pair of charges, calculated from Eq. (23.9).

**Set Up:** Let 1 be where all the charges are infinitely far apart. Let 2 be where the charges are at the corners of the triangle, as shown in Figure 23.11.

Let \( q_c \) be the third, unknown charge.

**Execute:** \( W = -\Delta U = -(U_2 - U_1) \), where \( W \) is the work done by the Coulomb force.

\[
U_1 = 0
\]

\[
U_2 = U_{ab} + U_{ac} + U_{bc} = \frac{1}{4\pi\varepsilon_0 d}(q^2 + 2qq_c)
\]

© Copyright 2012 Pearson Education, Inc. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.
Want $W=0$, so $W = -(U_a - U_b)$ gives $0 = -U_b$

$$0 = \frac{1}{4\pi\varepsilon_0 d} (q^2 + 2qq_c)$$

$q^2 + 2qq_c = 0$ and $q_c = -q/2$.

**Evaluate:** The potential energy for the two charges $q$ is positive and for each $q$ with $q_c$ it is negative. There are two of the $q$, $q_c$ terms so must have $q_c < q$.

**23.12. Identify:** Use conservation of energy $U_a + K_a = U_b + K_b$ to find the distance of closest approach $r_b$.

The maximum force is at the distance of closest approach, $F = k \frac{|q|q_2}{r_b^2}$.

**Set Up:** $K_b = 0$. Initially the two protons are far apart, so $U_a = 0$. A proton has mass $1.67 \times 10^{-27}$ kg and charge $q = +e = +1.60 \times 10^{-19}$ C.

**Execute:** $K_a = U_b$, $2\left(\frac{1}{2}mv_a^2\right) = k \frac{q_1q_2}{r_b}$, $mv_a^2 = k \frac{e^2}{r_b}$ and

$$r_b = \frac{ke^2}{mv_a^2} = \frac{(8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(1.60 \times 10^{-19} \text{ C})^2}{(1.67 \times 10^{-27} \text{ kg})(1.00 \times 10^6 \text{ m/s})^2} = 1.38 \times 10^{-13} \text{ m}.$$  

$$F = k \frac{e^2}{r_b^2} = (8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(1.60 \times 10^{-19} \text{ C})^2 \left(\frac{1}{(1.38 \times 10^{-13} \text{ m})^2}\right) = 0.012 \text{ N}.$$  

**Evaluate:** The acceleration $a = F/m$ of each proton produced by this force is extremely large.

**23.13. Identify and Set Up:** Apply conservation of energy to points $A$ and $B$.

**Execute:** $K_A + U_A = K_B + U_B$

$U = qV$, so $K_A + qV_A = K_B + qV_B$

$K_A = K_B + q(V_A - V_B) = 0.00250 \text{ J} + (-5.00 \times 10^{-6} \text{ C})(200 \text{ V} - 800 \text{ V}) = 0.00550 \text{ J}$

$v_B = \sqrt{2K_B/m} = 7.42 \text{ m/s}$

**Evaluate:** It is faster at $B$; a negative charge gains speed when it moves to higher potential.

**23.14. Identify:** The work-energy theorem says $W_{a\rightarrow b} = K_b - K_a$, $W_{a\rightarrow b} = \frac{1}{q} W_{a\rightarrow b}$.

**Set Up:** Point $a$ is the starting point and point $b$ is the ending point. Since the field is uniform, $W_{a\rightarrow b} = F \cdot s \cos \phi = E|\vec{q}|s \cos \phi$. The field is to the left so the force on the positive charge is to the left. The particle moves to the left so $\phi = 0^\circ$, and the work $W_{a\rightarrow b}$ is positive.

**Execute:** (a) $W_{a\rightarrow b} = K_b - K_a = 1.50 \times 10^{-6} \text{ J} - 0 = 1.50 \times 10^{-6} \text{ J}$

(b) $V_a - V_b = \frac{W_{a\rightarrow b}}{q} = \frac{1.50 \times 10^{-6} \text{ J}}{4.20 \times 10^{-9} \text{ C}} = 357 \text{ V}$. Point $a$ is at higher potential than point $b$.

(c) $E|\vec{q}|s = W_{a\rightarrow b}$, so $E = \frac{W_{a\rightarrow b}}{q|\vec{s}|} = \frac{V_a - V_b}{s} = \frac{357 \text{ V}}{6.00 \times 10^{-2} \text{ m}} = 5.95 \times 10^3 \text{ V/m}$.

**Evaluate:** A positive charge gains kinetic energy when it moves to lower potential; $V_b < V_a$.

**23.15. Identify:** Apply the equation that precedes Eq. (23.17): $W_{a\rightarrow b} = \int_a^b \vec{E} \cdot d\vec{l}$.

**Set Up:** Use coordinates where $+y$ is upward and $+x$ is to the right. Then $\vec{E} = E\hat{j}$ with $E = 4.00 \times 10^4 \text{ N/C}$. 

© Copyright 2012 Pearson Education, Inc. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.
(a) The path is sketched in Figure 23.15a.

\[ \vec{E} \cdot d\vec{l} = (\vec{E}) \cdot (d\vec{x}) = 0 \] so \( W_{a \to b} = q \int_{a}^{b} \vec{E} \cdot d\vec{l} = 0. \)

**EXECUTE:** \( \vec{E} \cdot d\vec{l} = (\vec{E}) \cdot (d\vec{x}) = E dy \)

\[ W_{a \to b} = q \int_{a}^{b} E dy = q'E(y_b - y_a) \]

\[ y_b - y_a = +0.670 \text{ m}, \text{ positive since the displacement is upward and we have taken } +y \text{ to be upward.} \]

\[ W_{a \to b} = q'E(y_b - y_a) = (+28.0 \times 10^{-9} \text{ C})(4.00 \times 10^4 \text{ N/C})(+0.670 \text{ m}) = +7.50 \times 10^{-4} \text{ J.} \]

**EVALUATE:** The electric force on the positive charge is upward so it does positive work for an upward displacement of the charge.

(b) **SET UP:** The path is sketched in Figure 23.15b.

\[ d\vec{l} = dy \hat{j} \]

\[ y = 0 \]

\[ y = -r \sin \theta = -(2.60 \text{ m}) \sin 45^\circ = -1.838 \text{ m} \]

The vertical component of the 2.60 m displacement is 1.838 m downward.

(c) **SET UP:** The path is sketched in Figure 23.15c.

\[ d\vec{l} = dx \hat{i} + dy \hat{j} \] (The displacement has both horizontal and vertical components.)

\[ \vec{E} \cdot d\vec{l} = (\vec{E}) \cdot (dx \hat{i} + dy \hat{j}) = E dy \] (Only the vertical component of the displacement contributes to the work.)

\[ W_{a \to b} = q \int_{a}^{b} \vec{E} \cdot d\vec{l} = q'E(y_b - y_a) \]

\[ W_{a \to b} = q'E(y_b - y_a) = (+28.0 \times 10^{-9} \text{ C})(4.00 \times 10^4 \text{ N/C})(-1.838 \text{ m}) = -2.06 \times 10^{-3} \text{ J.} \]

**EVALUATE:** The electric force on the positive charge is upward so it does negative work for a displacement of the charge that has a downward component.
23.16. **IDENTIFY:** Apply $K_a + U_a = K_b + U_b$.

**SET UP:** Let $q_1 = +3.00$ nC and $q_2 = +2.00$ nC. At point $a$, $r_{1a} = r_{2a} = 0.250$ m. At point $b$, $r_{1b} = 0.100$ m and $r_{2b} = 0.400$ m. The electron has $q = -e$ and $m_e = 9.11 \times 10^{-31}$ kg. $K_a = 0$ since the electron is released from rest.

**EXECUTE:**

$$E_a = K_a + U_a = k\left(-1.60 \times 10^{-19} \text{ C}\right) \left(\frac{3.00 \times 10^{-9} \text{ C}}{0.250 \text{ m}} + \frac{2.00 \times 10^{-9} \text{ C}}{0.250 \text{ m}}\right) = -2.88 \times 10^{-17} \text{ J}.$$ 

$$E_b = K_b + U_b = k\left(-1.60 \times 10^{-19} \text{ C}\right) \left(\frac{3.00 \times 10^{-9} \text{ C}}{0.100 \text{ m}} + \frac{2.00 \times 10^{-9} \text{ C}}{0.400 \text{ m}}\right) + \frac{1}{2} m_e v_b^2 = -5.04 \times 10^{-17} \text{ J} + \frac{1}{2} m_e v_b^2.$$ 

Setting $E_a = E_b$ gives 

$$v_b = \sqrt{\frac{2}{9.11 \times 10^{-31} \text{ kg}}} \left(5.04 \times 10^{-17} \text{ J} - 2.88 \times 10^{-17} \text{ J}\right) = 6.89 \times 10^6 \text{ m/s}.$$ 

**EVALUATE:** $V_a = V_{1a} + V_{2a} = 180$ V. $V_b = V_{1b} + V_{2b} = 315$ V. $V_b > V_a$. The negatively charged electron gains kinetic energy as it moves to higher potential.

23.17. **IDENTIFY:** The potential at any point is the scalar sum of the potentials due to individual charges.

**SET UP:** $V = kq/r$ and $W_{ab} = q(V_a - V_b)$.

**EXECUTE:**

(a) $r_{1a} = r_{2a} = 1/2\sqrt{(0.0300 \text{ m})^2 + (0.0300 \text{ m})^2} = 0.0212$ m. $V_a = k \left(\frac{q_1}{r_{1a}} + \frac{q_2}{r_{2a}}\right) = 0$.

(b) $r_{1b} = 0.0424$ m, $r_{2b} = 0.0300$ m. 

$$V_b = k \left(\frac{q_1}{r_{1b}} + \frac{q_2}{r_{2b}}\right) = (8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \left(\frac{+2.00 \times 10^{-6} \text{ C}}{0.0424 \text{ m}} + \frac{-2.00 \times 10^{-6} \text{ C}}{0.0300 \text{ m}}\right) = -1.75 \times 10^5 \text{ V}.$$ 

(c) $W_{ab} = q_1(V_a - V_b) = (-5.00 \times 10^{-6} \text{ C})[0 - (-1.75 \times 10^5 \text{ V})] = -0.875$ J.

**EVALUATE:** Since $V_b < V_a$, a positive charge would be pulled by the existing charges from $a$ to $b$, so they would do positive work on this charge. But they would repel a negative charge and hence do negative work on it, as we found in part (c).

23.18. **IDENTIFY:** The total potential is the **scalar** sum of the individual potentials, but the net electric field is the **vector** sum of the two fields.

**SET UP:** The net potential can only be zero if one charge is positive and the other is negative, since it is a scalar. The electric field can only be zero if the two fields point in opposite directions.

**EXECUTE:**

(a) (i) Since both charges have the same sign, there are no points for which the potential is zero.

(ii) The two electric fields are in opposite directions only between the two charges, and midway between them the fields have equal magnitudes. So $E = 0$ midway between the charges, but $V$ is never zero.

(b) (i) The two potentials have equal magnitude but opposite sign midway between the charges, so $V = 0$ midway between the charges, but $E \neq 0$ there since the fields point in the same direction.

(ii) Between the two charges, the fields point in the same direction, so $E$ cannot be zero there. In the other two regions, the field due to the nearer charge is always greater than the field due to the more distant charge, so they cannot cancel. Hence $E$ is not zero anywhere.

**EVALUATE:** It does **not** follow that the electric field is zero where the potential is zero, or that the potential is zero where the electric field is zero.
23.19. **IDENTIFY:** \( V = \frac{1}{4\pi\varepsilon_0} \sum \frac{q_i}{r_i} \)

**SET UP:** The locations of the changes and points \( A \) and \( B \) are sketched in Figure 23.19.

![Figure 23.19](image)

**Figure 23.19**

**EXECUTE:** (a) \( V_A = \frac{1}{4\pi\varepsilon_0} \left( \frac{q_1}{r_{A1}} + \frac{q_2}{r_{A2}} \right) \)

\[
V_A = \left(8.988 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2 \right) \left\{ \frac{+2.40 \times 10^{-9} \text{ C}}{0.050 \text{ m}} + \frac{-6.50 \times 10^{-9} \text{ C}}{0.050 \text{ m}} \right\} = -737 \text{ V}
\]

(b) \( V_B = \frac{1}{4\pi\varepsilon_0} \left( \frac{q_1}{r_{B1}} + \frac{q_2}{r_{B2}} \right) \)

\[
V_B = \left(8.988 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2 \right) \left\{ \frac{+2.40 \times 10^{-9} \text{ C}}{0.080 \text{ m}} + \frac{-6.50 \times 10^{-9} \text{ C}}{0.060 \text{ m}} \right\} = -704 \text{ V}
\]

(c) **IDENTIFY** and **SET UP:** Use Eq. (23.13) and the results of parts (a) and (b) to calculate \( W \).

**EXECUTE:** \( W_{B \rightarrow A} = q(V_B - V_A) = (2.50 \times 10^{-9} \text{ C})(-704 \text{ V} - (-737 \text{ V})) = +8.2 \times 10^{-8} \text{ J} \)

**EVALUATE:** The electric force does positive work on the positive charge when it moves from higher potential (point \( B \)) to lower potential (point \( A \)).

23.20. **IDENTIFY:** For a point charge, \( V = \frac{kq}{r} \). The total potential at any point is the algebraic sum of the potentials of the two charges.

**SET UP:** Consider the distances from the point on the \( y \)-axis to each charge for the three regions 
- \( -a \leq y \leq a \) (between the two charges), \( y > a \) (above both charges) and \( y < -a \) (below both charges).

**EXECUTE:** (a) \( y < -a : V = \frac{kq}{(a+y)} \left[ \frac{kq}{(a-y)} \right] = \frac{2kqv}{y^2 - a^2} \). \( y > a : V = \frac{kq}{(a+y)} - \frac{kq}{y-a} = \frac{-2kqa}{y^2 - a^2} \).

\[ y < -a : V = -\frac{kq}{(a+y)} - \frac{kq}{(a-y)} = \frac{2kqa}{y^2 - a^2} \]

A general expression valid for any \( y \) is \( V = k \left( \frac{-q}{y-a} + \frac{q}{y+a} \right) \).

(b) The graph of \( V \) versus \( y \) is sketched in Figure 23.20.

(c) \( y >> a : V = -\frac{2kqa}{y^2 - a^2} = \frac{-2kqa}{y^2} \).

(d) If the charges are interchanged, then the potential is of the opposite sign.

**EVALUATE:** \( V = 0 \) at \( y = 0 \), \( V \rightarrow +\infty \) as the positive charge is approached and \( V \rightarrow -\infty \) as the negative charge is approached.
23.21. **IDENTIFY:** For a point charge, \( V' = \frac{kq}{r} \). The total potential at any point is the algebraic sum of the potentials of the two charges.

**SET UP:** (a) The positions of the two charges are shown in Figure 23.21a.

![Figure 23.21a](image)

(b) \( x > a \): \( V' = \frac{kq}{x} - \frac{2kq}{x-a} = \frac{-kq(x+a)}{x(x-a)} \). \( 0 < x < a \): \( V' = \frac{kq}{x} - \frac{2kq}{a-x} = \frac{kq(3x-a)}{x(x-a)} \).

\( x < 0 \): \( V' = -\frac{kq}{x} + \frac{2kq}{x-a} = \frac{kq(x+a)}{x(x-a)} \). A general expression valid for any \( y \) is \( V' = k \left( \frac{q}{|x|} - \frac{2q}{x-a} \right) \).

(c) The potential is zero at \( x = -a \) and \( a/3 \).

(d) The graph of \( V' \) versus \( x \) is sketched in Figure 23.21b.

![Figure 23.21 b](image)
**Electric Potential**

**Evaluate:** (e) For \( x \gg a \): \( V' = -\frac{kq}{x^2} = -\frac{kq}{r} \), which is the same as the potential of a point charge \(-q\).

Far from the two charges they appear to be a point charge with a charge that is the algebraic sum of their two charges.

**23.22.** **Identify:** For a point charge, \( V = \frac{kq}{r} \). The total potential at any point is the algebraic sum of the potentials of the two charges.

**Set Up:** The distance of a point with coordinate \( y \) from the positive charge is \( |y| \) and the distance from the negative charge is \( r = \sqrt{a^2 + y^2} \).

**Evaluate:** (a) \( V' = \frac{kq}{|y|} - \frac{2kq}{r} = kq \left( \frac{1}{|y|} - \frac{2}{\sqrt{a^2 + y^2}} \right) \).

(b) \( V' = 0 \), when \( y^2 = \frac{a^2 + y^2}{4} \Rightarrow 3y^2 = a^2 \Rightarrow y = \pm \frac{a}{\sqrt{3}} \).

(e) The graph of \( V' \) versus \( y \) is sketched in Figure 23.22. \( V' \rightarrow \infty \) as the positive charge at the origin is approached.

**Evaluate:** (d) \( y \gg a \): \( V' = kq \left( \frac{1}{y} - \frac{2}{y'} \right) = -\frac{kq}{y} \), which is the potential of a point charge \(-q\). Far from the two charges they appear to be a point charge with a charge that is the algebraic sum of their two charges.

**Figure 23.22**

**23.23.** **Identify and Set Up:** Apply conservation of energy, Eq. (23.3). Use Eq. (23.12) to express \( U \) in terms of \( V \).

(a) **Execute:** \( K_1 + qV_1 = K_2 + qV_2 \), \( q(V_2 - V_1) = K_1 - K_2 \), \( q = -1.602 \times 10^{-19} \text{ C} \).

\( K_1 = \frac{1}{2} m_p v_1^2 = 4.099 \times 10^{-18} \text{ J}; \ K_2 = \frac{1}{2} m_e v_2^2 = 2.915 \times 10^{-17} \text{ J} \). \( \Delta V = V_2 - V_1 = \frac{K_1 - K_2}{q} = 156 \text{ V} \).

**Evaluate:** The electron gains kinetic energy when it moves to higher potential.

(b) **Execute:** Now \( K_1 = 2.915 \times 10^{-17} \text{ J}, K_2 = 0 \). \( V_2 - V_1 = \frac{K_1 - K_2}{q} = -182 \text{ V} \).

**Evaluate:** The electron loses kinetic energy when it moves to lower potential.

**23.24.** **Identify:** For a point charge, \( E = \frac{kq}{r^2} \) and \( V = \frac{kq}{r} \).

**Set Up:** The electric field is directed toward a negative charge and away from a positive charge.

**Execute:** (a) \( V > 0 \) so \( q > 0 \). \( V = \frac{kq}{r} \), \( \frac{V}{E} = \frac{\frac{kq}{r}}{\frac{kq}{r^2}} = \frac{r^2}{r} = r \). \( E = \frac{4.98 \text{ V}}{12.0 \text{ V/m}} = 0.415 \text{ m} \).

© Copyright 2012 Pearson Education, Inc. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.
(b) \[ q = \frac{rV}{k} = \frac{(0.415 \text{ m})(4.98 \text{ V})}{8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2} = 2.30 \times 10^{-10} \text{ C} \]

(c) \( q > 0 \), so the electric field is directed away from the charge.

**Evaluate:** The ratio of \( V \) to \( E \) due to a point charge increases as the distance \( r \) from the charge increases, because \( E \) falls off as \( 1/r^2 \) and \( V \) falls off as \( 1/r \).

### 23.25.

(a) **Identify and Set Up:** The direction of \( \vec{E} \) is always from high potential to low potential so point \( b \) is at higher potential.

(b) Apply Eq. (23.17) to relate \( V_b - V_a \) to \( E \).

**Execute:** \[ V_b - V_a = -\int_a^b \vec{E} \cdot d\vec{l} = \int_a^b E \, dx = E(x_b - x_a). \]

\[ E = \frac{V_b - V_a}{x_b - x_a} = \frac{240 \text{ V}}{0.90 \text{ m} - 0.60 \text{ m}} = 800 \text{ V/m} \]

(c) \( W_{b\rightarrow a} = q(V_b - V_a) = (-0.200 \times 10^{-6} \text{ C})(+240 \text{ V}) = -4.80 \times 10^{-5} \text{ J} \).

**Evaluate:** The electric force does negative work on a negative charge when the negative charge moves from high potential (point \( b \)) to low potential (point \( a \)).

### 23.26.

**Identify:** For a point charge, \( V = \frac{kq}{r} \). The total potential at any point is the algebraic sum of the potentials of the two charges. For a point charge, \( E = \frac{kq}{r^2} \). The net electric field is the vector sum of the electric fields of the two charges.

**Set Up:** \( \vec{E} \) produced by a point charge is directed away from the point charge if it is positive and toward the charge if it is negative.

**Execute:** (a) \( V = V_Q + V_{2Q} > 0 \), so \( V \) is zero nowhere except for infinitely far from the charges. The fields can cancel only between the charges, because only there are the fields of the two charges in opposite directions. Consider a point a distance \( x \) from \( Q \) and \( d - x \) from \( 2Q \), as shown in Figure 23.26a.

\[ E_Q = E_{2Q} \rightarrow \frac{kQ}{x^2} = \frac{k(2Q)}{(d-x)^2} \rightarrow (d-x)^2 = 2x^2 \cdot x = \frac{d}{1 + \sqrt{2}}. \] The other root, \( x = \frac{d}{1 - \sqrt{2}} \), does not lie between the charges.

(b) \( V \) can be zero in 2 places, \( A \) and \( B \), as shown in Figure 23.26b. Point \( A \) is a distance \( x \) from \(-Q\) and \( d - x \) from \( 2Q \). \( B \) is a distance \( y \) from \(-Q\) and \( d + y \) from \( 2Q \). At \( A \): \[ \frac{k(-Q)}{x} + \frac{k(2Q)}{d-x} = 0 \rightarrow x = d/3. \]

At \( B \): \[ \frac{k(-Q)}{y} + \frac{k(2Q)}{d+y} = 0 \rightarrow y = d. \]

The two electric fields are in opposite directions to the left of \(-Q\) or to the right of \( 2Q \) in Figure 23.26c. But for the magnitudes to be equal, the point must be closer to the charge with smaller magnitude of charge. This can be the case only in the region to the left of \(-Q\). \( E_Q = E_{2Q} \) gives \( \frac{kQ}{x^2} = \frac{k(2Q)}{(d+x)^2} \) and

\[ x = \frac{d}{\sqrt{2} - 1}. \]

**Evaluate:** (d) \( E \) and \( V \) are not zero at the same places. \( \vec{E} \) is a vector and \( V \) is a scalar. \( E \) is proportional to \( 1/r^2 \) and \( V \) is proportional to \( 1/r \). \( \vec{E} \) is related to the force on a test charge and \( \Delta V \) is related to the work done on a test charge when it moves from one point to another.

![Figure 23.26](image-url)
23.27. **Identify:** The potential at any point is the scalar sum of the potential due to each shell.

**Set Up:** \[ V = \frac{kq}{R} \text{ for } r \leq R \text{ and } V = \frac{kq}{r} \text{ for } r > R. \]

**Execute:**
(a) \( i \) \( r = 0 \). This point is inside both shells so
\[
V = k \left( \frac{q_1 + q_2}{R_1 + R_2} \right) = (8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \left( \frac{6.00 \times 10^{-9} \text{ C}}{0.0300 \text{ m}} + \frac{-9.00 \times 10^{-9} \text{ C}}{0.0500 \text{ m}} \right).
\]
\[ V = +1.798 \times 10^3 \text{ V} + (-1.618 \times 10^3 \text{ V}) = 180 \text{ V}. \]

(ii) \( r = 4.00 \text{ cm} \). This point is outside shell 1 and inside shell 2.
\[
V = k \left( \frac{q_1 + q_2}{r} \right) = (8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \left( \frac{6.00 \times 10^{-9} \text{ C}}{0.0400 \text{ m}} + \frac{-9.00 \times 10^{-9} \text{ C}}{0.0500 \text{ m}} \right).
\]
\[ V = +1.348 \times 10^3 \text{ V} + (-1.618 \times 10^3 \text{ V}) = -270 \text{ V}. \]

(iii) \( r = 6.00 \text{ cm} \). This point is outside both shells.
\[
V = k \left( \frac{q_1 + q_2}{r} \right) = \frac{8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2}{0.0600 \text{ m}} \left( \frac{6.00 \times 10^{-9} \text{ C}}{r} + \frac{-9.00 \times 10^{-9} \text{ C}}{r} \right). \]
\[ V = -450 \text{ V}. \]

(b) At the surface of the inner shell, \( r = R_1 = 3.00 \text{ cm} \). This point is inside the larger shell, so
\[ V_1 = k \left( \frac{q_1 + q_2}{R_1} \right) = 180 \text{ V}. \]
At the surface of the outer shell, \( r = R_2 = 5.00 \text{ cm} \). This point is outside the smaller shell, so
\[ V_2 = k \left( \frac{q_1 + q_2}{R_2} \right) = (8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \left( \frac{6.00 \times 10^{-9} \text{ C}}{0.0500 \text{ m}} + \frac{-9.00 \times 10^{-9} \text{ C}}{0.0500 \text{ m}} \right). \]
\[ V_2 = +1.079 \times 10^3 \text{ V} + (-1.618 \times 10^3 \text{ V}) = -539 \text{ V}. \]

The potential difference is \( V_1 - V_2 = 719 \text{ V} \). The inner shell is at higher potential. The potential difference is due entirely to the charge on the inner shell.

**Evaluate:** Inside a uniform spherical shell, the electric field is zero so the potential is constant (but not necessarily zero).

23.28. **Identify** and **Set Up:** Expressions for the electric potential inside and outside a solid conducting sphere are derived in Example 23.8.

**Execute:**
(a) This is outside the sphere, so
\[ V = \frac{kq}{r} = \frac{k(3.50 \times 10^{-9} \text{ C})}{0.480 \text{ m}} = 65.6 \text{ V}. \]

(b) This is at the surface of the sphere, so
\[ V = \frac{k(3.50 \times 10^{-9} \text{ C})}{0.240 \text{ m}} = 131 \text{ V}. \]

(c) This is inside the sphere. The potential has the same value as at the surface, 131 V.

**Evaluate:** All points of a conductor are at the same potential.

23.29. **(a) Identify** and **Set Up:** The electric field on the ring's axis is calculated in Example 21.9. The force on the electron exerted by this field is given by Eq. (21.3).

**Execute:** When the electron is on either side of the center of the ring, the ring exerts an attractive force directed toward the center of the ring. This restoring force produces oscillatory motion of the electron along the axis of the ring, with amplitude 30.0 cm. The force on the electron is not of the form \( F = -kx \) so the oscillatory motion is not simple harmonic motion.

(b) **Identify:** Apply conservation of energy to the motion of the electron.

**Set Up:** \( K_a + U_a = K_b + U_b \) with \( a \) at the initial position of the electron and \( b \) at the center of the ring.

From Example 23.11, \( V = \frac{1}{4\pi \varepsilon_0} \frac{Q}{\sqrt{x^2 + R^2}} \), where \( R \) is the radius of the ring.

**Execute:** \( x_a = 30.0 \text{ cm}, x_b = 0 \).
\[ K_a = 0 \text{ (released from rest)}, K_b = \frac{1}{2}mv^2 \]

Thus \( \frac{1}{2}mv^2 = U_a - U_b \)
And $U = qV = -eV$ so $v = \sqrt{\frac{2e(V_a - V_b)}{m}}.$

$$V_a = \frac{1}{4\pi \varepsilon_0} \frac{Q}{\sqrt{X_a^2 + R^2}} = \frac{(8.988 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \cdot 24.0 \times 10^{-9} \text{ C}}{\sqrt{(0.300 \text{ m})^2 + (0.150 \text{ m})^2}} = 643 \text{ V}$$

$$V_b = \frac{1}{4\pi \varepsilon_0} \frac{Q}{\sqrt{X_b^2 + R^2}} = \frac{(8.988 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \cdot 24.0 \times 10^{-9} \text{ C}}{0.150 \text{ m}} = 1438 \text{ V}$$

$$v = \sqrt{\frac{2e(V_a - V_b)}{m}} = \sqrt{\frac{2(1.602 \times 10^{-19} \text{ C})(1438 \text{ V} - 643 \text{ V})}{9.109 \times 10^{-31} \text{ kg}}} = 1.67 \times 10^7 \text{ m/s}$$

**Evaluate:** The positively charged ring attracts the negatively charged electron and accelerates it. The electron has its maximum speed at this point. When the electron moves past the center of the ring the force on it is opposite to its motion and it slows down.

23.30. **Identify:** Example 23.10 shows that for a line of charge, $V_a - V_b = \frac{\lambda}{2\pi \varepsilon_0} \ln\left(\frac{r_b}{r_a}\right)$. Apply conservation of energy to the motion of the proton.

**Set Up:** Let point $a$ be 18.0 cm from the line and let point $b$ be at the distance of closest approach, where $K_a = 0$.

**Execute:**

(a) $K_a = \frac{1}{2}mv^2 = \frac{1}{2}(1.67 \times 10^{-27} \text{ kg})(1.50 \times 10^3 \text{ m/s})^2 = 1.88 \times 10^{-21} \text{ J}$.

(b) $K_a + qV_a = K_b + qV_b$, $V_a - V_b = \frac{K_a - K_b}{q} = \frac{-1.88 \times 10^{-21} \text{ J}}{1.60 \times 10^{-19} \text{ C}} = -0.01175 \text{ V}$.

$$\ln\left(\frac{r_b}{r_a}\right) = \left(\frac{2\pi \varepsilon_0}{\lambda}\right)(-0.01175 \text{ V}).$$

$$r_b = r_a \exp\left(\frac{2\pi \varepsilon_0(-0.01175 \text{ V})}{\lambda}\right) = (0.180 \text{ m}) \exp\left(-\frac{2\pi \varepsilon_0(0.01175 \text{ V})}{5.00 \times 10^{-12} \text{ C/m}}\right) = 0.158 \text{ m}.$$

**Evaluate:** The potential increases with decreasing distance from the line of charge. As the positively charged proton approaches the line of charge it gains electrical potential energy and loses kinetic energy.

23.31. **Identify:** The voltmeter measures the potential difference between the two points. We must relate this quantity to the linear charge density on the wire.

**Set Up:** For a very long (infinite) wire, the potential difference between two points is

$$\Delta V = \frac{\lambda}{2\pi \varepsilon_0} \ln\left(\frac{r_b}{r_a}\right).$$

**Execute:**

(a) Solving for $\lambda$ gives

$$\lambda = \frac{(\Delta V)2\pi \varepsilon_0}{\ln\left(\frac{r_b}{r_a}\right)} = \frac{575 \text{ V}}{(18 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \ln\left(\frac{3.50 \text{ cm}}{2.50 \text{ cm}}\right)} = 9.49 \times 10^{-8} \text{ C/m}$$

(b) The meter will read less than 575 V because the electric field is weaker over this 1.00-cm distance than it was over the 1.00-cm distance in part (a).

(c) The potential difference is zero because both probes are at the same distance from the wire, and hence at the same potential.

**Evaluate:** Since a voltmeter measures potential difference, we are actually given $\Delta V$, even though that is not stated explicitly in the problem.

23.32. **Identify:** The voltmeter reads the potential difference between the two points where the probes are placed. Therefore we must relate the potential difference to the distances of these points from the center of the cylinder. For points outside the cylinder, its electric field behaves like that of a line of charge.
Set Up: Using \( \Delta V = \frac{\lambda}{2\pi\epsilon_0} \ln \left( \frac{r_b}{r_a} \right) \) and solving for \( r_b \), we have \( r_b = r_a e^{2\pi\epsilon_0 \Delta V/\lambda} \).

Execute: The exponent is 
\[ \frac{1}{2 \times 9.00 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2} \left( \frac{175 \text{ V}}{15.0 \times 10^{-9} \text{ C/m}} \right) = 0.648, \] 
which gives 
\( r_b = (2.50 \text{ cm}) \cdot e^{0.648} = 4.78 \text{ cm} \).

The distance above the surface is \( 4.78 \text{ cm} - 2.50 \text{ cm} = 2.28 \text{ cm} \).

Evaluate: Since a voltmeter measures potential difference, we are actually given \( \Delta V \), even though that is not stated explicitly in the problem. We must also be careful when using the formula for the potential difference because each \( r \) is the distance from the center of the cylinder, not from the surface.

23.33. Identify: For points outside the cylinder, its electric field behaves like that of a line of charge. Since a voltmeter reads potential difference, that is what we need to calculate.

Set Up: The potential difference is \( \Delta V = \frac{\lambda}{2\pi\epsilon_0} \ln \left( \frac{r_b}{r_a} \right) \).

Execute: (a) Substituting numbers gives 
\[ \Delta V = \frac{\lambda}{2\pi\epsilon_0} \ln \left( \frac{r_b}{r_a} \right) = (8.50 \times 10^{-5} \text{ C/m})(2 \times 9.00 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \ln \left( \frac{10.0 \text{ cm}}{6.00 \text{ cm}} \right) \]
\( \Delta V = 7.82 \times 10^4 \text{ V} = 78,200 \text{ V} = 78.2 \text{ kV} \)

(b) \( E = 0 \) inside the cylinder, so the potential is constant there, meaning that the voltmeter reads zero.

Evaluate: Caution! The fact that the voltmeter reads zero in part (b) does not mean that \( V = 0 \) inside the cylinder. The electric field is zero, but the potential is constant and equal to the potential at the surface.

23.34. Identify: The work required is equal to the change in the electrical potential energy of the charge-ring system. We need only look at the beginning and ending points, since the potential difference is independent of path for a conservative field.

Set Up: (a) \( W = \Delta U = q\Delta V = q(V_{\text{center}} - V_{\infty}) = q \left( \frac{1}{4\pi\epsilon_0} \frac{Q}{a} - 0 \right) \)

Execute: Substituting numbers gives 
\[ \Delta U = (3.00 \times 10^{-6} \text{ C})(9.00 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(5.00 \times 10^{-6} \text{ C})(0.0400 \text{ m}) = 3.38 \text{ J} \]

(b) We can take any path since the potential is independent of path.

(c) Set Up: The net force is away from the ring, so the ball will accelerate away. Energy conservation gives \( U_0 = K_{\text{max}} = \frac{1}{2}mv^2 \).

Execute: Solving for \( v \) gives 
\[ v = \sqrt{ \frac{2U_0}{m} } = \sqrt{ \frac{2(3.38 \text{ J})}{0.00150 \text{ kg}} } = 67.1 \text{ m/s} \.

Evaluate: Direct calculation of the work from the electric field would be extremely difficult, and we would need to know the path followed by the charge. But, since the electric field is conservative, we can bypass all this calculation just by looking at the end points (infinity and the center of the ring) using the potential.

23.35. Identify: The electric field of the line of charge does work on the sphere, increasing its kinetic energy.

Set Up: \( K_1 + U_1 = K_2 + U_2 \) and \( K_1 = 0 \). \( U = qV \) so \( qV_1 = K_2 + qV_2 \). \( V = \frac{\lambda}{2\pi\epsilon_0} \ln \left( \frac{r_b}{r_a} \right) \).

Execute: \( V_1 = \frac{\lambda}{2\pi\epsilon_0} \ln \left( \frac{r_b}{r_1} \right) \).
\( V_2 = \frac{\lambda}{2\pi\epsilon_0} \ln \left( \frac{r_b}{r_2} \right) \).
\[ K_2 = q(V_1' - V_2) = \frac{\lambda}{2\pi \varepsilon_0} \left( \ln \left( \frac{r_0}{\eta} \right) - \ln \left( \frac{r_0}{r_2} \right) \right) = \frac{\lambda q}{2\pi \varepsilon_0} \left( \ln r_2 - \ln \eta \right) = \frac{\lambda q}{2\pi \varepsilon_0} \ln \left( \frac{r_2}{\eta} \right). \]

\[ K_2 = \frac{\left(3.00 \times 10^{-6} \text{ C/m}\right)\left(8.00 \times 10^{-6} \text{ C}\right)}{2\pi \left(8.854 \times 10^{-12} \text{ C}^2/(\text{N} \cdot \text{m}^2)\right)} \ln \left(\frac{4.50}{1.50}\right) = 0.474 \text{ J.} \]

**Evaluate:** The potential due to the line of charge does not go to zero at infinity but is defined to be zero at an arbitrary distance \( r_0 \) from the line.

**23.36. Identify:** If the small sphere is to have its minimum speed, it must just stop at 8.00 cm from the surface of the large sphere. In that case, the initial kinetic energy of the small sphere is all converted to electrical potential energy at its point of closest approach.

**Set up:** \( K_1 + U_1 = K_2 + U_2 \). \( K_2 = 0 \). \( U_1 = 0 \). Therefore, \( K_1 = U_2 \). Outside a spherical charge distribution the potential is the same for a point charge at the location of the center of the sphere, so \( U = kqQ/r \). \( K = \frac{1}{2}mv^2 \).

**Execute:** \( U_2 = \frac{kqQ}{r_2} \), with \( r_2 = 12.0 \text{ cm} + 8.0 \text{ cm} = 200.0 \text{ m} \). \( \frac{1}{2}mv_1^2 = \frac{kqQ}{r_2} \).

\[ v_1 = \sqrt{\frac{2kqQ}{m r_2}} = \sqrt{\frac{2(8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(3.00 \times 10^{-6} \text{ C})(5.00 \times 10^{-6} \text{ C})}{(6.00 \times 10^{-5} \text{ kg})(0.200 \text{ m})}} = 150 \text{ m/s.} \]

**Evaluate:** If the small sphere had enough initial speed to actually penetrate the surface of the large sphere, we could no longer treat the large sphere as a point charge once the small sphere was inside.

**23.37. Identify:** We can model the axon membrane as a large sheet having equal but opposite charges on its opposite faces.

**Set up:** For two oppositely charged sheets of charge, \( V_{ab} = Ed \). The positively charged sheet is the one at higher potential.

**Execute:** (a) \( E = \frac{V_{ab}}{d} = \frac{70 \times 10^{-3} \text{ V}}{7.5 \times 10^{-9} \text{ m}} = 9.3 \times 10^6 \text{ V/m.} \) The electric field is directed inward, toward the interior of the axon, since the outer surface of the membrane has positive charge and \( \vec{E} \) points away from positive charge and toward negative charge.

(b) The outer surface has positive charge so it is at higher potential than the inner surface.

**Evaluate:** The electric field is quite strong compared to ordinary laboratory fields in devices such as student oscilloscopes. The potential difference is only 70 mV, but it occurs over a distance of only 7.5 nm.

**23.38. Identify** and **Set up:** For oppositely charged parallel plates, \( E = \sigma/\varepsilon_0 \) between the plates and the potential difference between the plates is \( V = Ed \).

**Execute:** (a) \( E = \frac{\sigma}{\varepsilon_0} = \frac{47.0 \times 10^{-9} \text{ C/m}^2}{\varepsilon_0} = 5310 \text{ N/C.} \)

(b) \( V = Ed = (5310 \text{ N/C})(0.0220 \text{ m}) = 117 \text{ V.} \)

(c) The electric field stays the same if the separation of the plates doubles. The potential difference between the plates doubles.

**Evaluate:** The electric field of an infinite sheet of charge is uniform, independent of distance from the sheet. The force on a test charge between the two plates is constant because the electric field is constant. The potential difference is the work per unit charge on a test charge when it moves from one plate to the other. When the distance doubles, the work, which is force times distance, doubles and the potential difference doubles.

**23.39. Identify** and **Set up:** Use the result of Example 23.9 to relate the electric field between the plates to the potential difference between them and their separation. The force this field exerts on the particle is given by Eq. (23.13). Use the equation that precedes Eq. (23.17) to calculate the work.

**Execute:** (a) From Example 23.9, \( E = \frac{V_{ab}}{d} = \frac{360 \text{ V}}{0.0450 \text{ m}} = 8000 \text{ V/m.} \)

(b) \( F = \frac{|q|E}{d} = (2.40 \times 10^{-9} \text{ C})(8000 \text{ V/m}) = +1.92 \times 10^{-5} \text{ N.} \)

(c) The electric field between the plates is shown in Figure 23.39.

![Electric Field Diagram]

Figure 22.39

The plate with positive charge (plate a) is at higher potential. The electric field is directed from high potential toward low potential (or, \( \vec{E} \) is from + charge toward – charge), so \( \vec{E} \) points from a to b. Hence the force that \( \vec{E} \) exerts on the positive charge is from a to b, so it does positive work.

\[
W = \int_a^b \vec{F} \cdot d\vec{l} = Fd, \quad \text{where} \quad d \quad \text{is the separation between the plates.}
\]

\[
W = Fd = (1.92 \times 10^{-5} \text{ N})(0.0450 \text{ m}) = 8.64 \times 10^{-7} \text{ J}
\]

(d) \( V_a - V_b = +360 \text{ V} \) (plate a is at higher potential)

\[
\Delta U = U_a - U_b = q(V_b - V_a) = (2.40 \times 10^{-9} \text{ C})(-360 \text{ V}) = -8.64 \times 10^{-7} \text{ J}
\]

**Evaluate:** We see that \( W_{a \rightarrow b} = -(U_a - U_b) = U_a - U_b \).

23.40. **Identify and Set Up:** \( V_{ab} = Ed \) for parallel plates.

**Execute:** \( d = \frac{V_{ab}}{E} = \frac{1.5 \text{ V}}{1.0 \times 10^{-6} \text{ V/m}} = 1.5 \times 10^6 \text{ m} = 1.5 \times 10^3 \text{ km.} \)

**Evaluate:** The plates would have to be nearly a thousand miles apart with only a AA battery across them! This is a small field!

23.41. **Identify and Set Up:** Consider the electric field outside and inside the shell and use that to deduce the potential.

**Execute:** (a) The electric field outside the shell is the same as for a point charge at the center of the shell, so the potential outside the shell is the same as for a point charge:

\[
V = \frac{q}{4\pi \varepsilon_0 r} \quad \text{for} \quad r > R.
\]

The electric field is zero inside the shell, so no work is done on a test charge as it moves inside the shell and all points inside the shell are at the same potential as the surface of the shell: \( V = \frac{q}{4\pi \varepsilon_0 R} \) for \( r \leq R \).

(b) \( V = \frac{q}{R} \) so \( q = \frac{RV}{k} = \frac{(0.15 \text{ m})(-1200 \text{ V})}{9} = -20 \text{ nC} \)

(e) **Evaluate:** No, the amount of charge on the sphere is very small. Since \( U = qV \) the total amount of electric energy stored on the balloon is only \((20 \text{ nC})(1200 \text{ nC}) = 2.4 \times 10^{-5} \text{ J.} \)

23.42. **Identify:** The electric field is zero inside the sphere, so the potential is constant there. Thus the potential at the center must be the same as at the surface, where it is equivalent to that of a point-charge.

**Set Up:** At the surface, and hence also at the center of the sphere, the potential is that of a point-charge, \( V = Q/(4\pi \varepsilon_0 R) \).

**Execute:** (a) Solving for \( Q \) and substituting the numbers gives

\[
Q = 4\pi \varepsilon_0 RV = (0.125 \text{ m})(1500 \text{ V})/(9.00 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) = 2.08 \times 10^{-8} \text{ C} = 20.8 \text{ nC}
\]

(b) Since the potential is constant inside the sphere, its value at the surface must be the same as at the center, 1.50 kV.

**Evaluate:** The electric field inside the sphere is zero, so the potential is constant but is not zero.

23.43. **Identify:** Example 23.8 shows that the potential of a solid conducting sphere is the same at every point inside the sphere and is equal to its value \( V = q/(4\pi \varepsilon_0 R) \) at the surface. Use the given value of \( E \) to find \( q \).

**Set Up:** For negative charge the electric field is directed toward the charge.
For points outside this spherical charge distribution the field is the same as if all the charge were concentrated at the center.

**EXECUTE:** \[ E = \frac{|q|}{4\pi\varepsilon_0 r^2} \] and \[ d = 4\pi\varepsilon_0 E r^2 = \frac{(3800 \text{ N/C})(0.200 \text{ m})^2}{8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2} = 1.69 \times 10^{-8} \text{ C}. \]

Since the field is directed inward, the charge must be negative. The potential of a point charge, taking \( \infty \) as zero, is \( V = \frac{q}{4\pi\varepsilon_0} = \frac{(8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(-1.69 \times 10^{-8} \text{ C})}{0.200 \text{ m}} = -760 \text{ V} \) at the surface of the sphere.

Since the charge all resides on the surface of a conductor, the field inside the sphere due to this symmetrical distribution is zero. No work is therefore done in moving a test charge from just inside the surface to the center, and the potential at the center must also be \(-760 \text{ V}\).

**EVALUATE:** Inside the sphere the electric field is zero and the potential is constant.

23.44. **IDENTIFY:** By the definition of electric potential, if a positive charge gains potential along a path, then the potential along that path must have increased. The electric field produced by a very large sheet of charge is uniform and is independent of the distance from the sheet.

(a) **SET UP:** No matter what the reference point, we must do work on a positive charge to move it away from the negative sheet.

(b) **EXECUTE:** Since we must do work on the positive charge, it gains potential energy, so the potential increases.

**EXECUTE:** Solving for \( d \) gives
\[ d = \frac{2\varepsilon_0\Delta V}{\sigma} = \frac{2(8.85 \times 10^{-12} \text{ C}^2/\text{N} \cdot \text{m}^2)(1.00 \text{ V})}{6.00 \times 10^{-9} \text{ C}/\text{m}^2} = 0.00295 \text{ m} = 2.95 \text{ mm} \]

**EVALUATE:** Since the spacing of the equipotential surfaces \((d = 2.95 \text{ mm})\) is independent of the distance from the sheet, the equipotential surfaces are planes parallel to the sheet and spaced 2.95 mm apart.

23.45. **IDENTIFY and SET UP:** Use Eq. (23.19) to calculate the components of \( \vec{E} \).

**EXECUTE:** \[ V = A\sigma + Bx^2 + Cy \]

(a) \[ E_x = -\frac{\partial V}{\partial x} = -Ay + 2Bx \]

\[ E_y = -\frac{\partial V}{\partial y} = -Ax - C \]

\[ E_z = -\frac{\partial V}{\partial z} = 0 \]

(b) \( E = 0 \) requires that \( E_x = E_y = E_z = 0. \)

\( E_z = 0 \) everywhere.

\( E_y = 0 \) at \( x = -CA. \)

And \( E_x \) is also equal to zero for this \( x \), any value of \( z \) and \( y = 2Bx/|A| = (2B/|A|)(-CA) = -2BC/A^2. \)

**EVALUATE:** \( V \) doesn’t depend on \( z \) so \( E_z = 0 \) everywhere.

23.46. **IDENTIFY:** Apply Eq. (23.19).

**SET UP:** Eq. (21.7) says \( \vec{E} = \frac{1}{4\pi\varepsilon_0} \frac{|q|}{r^2} \) is the electric field due to a point charge \( q \).

**EXECUTE:** (a) \[ E_x = -\frac{\partial V}{\partial x} = -\frac{kQ}{(x^2 + y^2 + z^2)^{3/2}} \]

Similarly, \( E_y = \frac{kQy}{r^3} \) and \( E_z = \frac{kQz}{r^3} \).
(b) From part (a), \[ E = \frac{kQ}{r^2} \left( \frac{\hat{x}}{r} + \frac{\hat{y}}{r} + \frac{\hat{z}}{r} \right) = \frac{kQ}{r^2} \hat{r}, \] which agrees with Eq. (21.7).

**Evaluate:** \( V \) is a scalar. \( \vec{E} \) is a vector and has components.

### 23.47

**Identify and Set Up:** For a solid metal sphere or for a spherical shell, \( V = \frac{q}{R} \) outside the sphere and \( V = \frac{q}{r} \) at all points inside the sphere, where \( R \) is the radius of the sphere. When the electric field is radial, \[ E = -\frac{\partial V}{\partial r}. \]

**Execute:**

1. **(i) \( r < r_a \):** This region is inside both spheres. \( V = \frac{kq}{r_a} - \frac{kq}{r_b} = kq \left( \frac{1}{r_a} - \frac{1}{r_b} \right) \).

2. **(ii) \( r_a < r < r_b \):** This region is outside the inner shell and inside the outer shell. \( V = \frac{kq}{r} - \frac{kq}{r_b} = kq \left( \frac{1}{r} - \frac{1}{r_b} \right) \).

3. **(iii) \( r > r_b \):** This region is outside both spheres and \( V = 0 \) since outside a sphere the potential is the same as for a point charge. Therefore the potential is the same as for two oppositely charged point charges at the same location. These potentials cancel.

\[ V_a = \frac{1}{4\pi\varepsilon_0} \left( \frac{q}{r_a} - \frac{q}{r_b} \right) \text{ and } V_b = 0, \text{ so } V_{ab} = \frac{1}{4\pi\varepsilon_0} \left( \frac{1}{r_a} - \frac{1}{r_b} \right). \]

4. **(c) Between the spheres \( r_a < r < r_b \) and \( V = kq \left( \frac{1}{r} - \frac{1}{r_b} \right) \).**

\[ E = -\frac{\partial V}{\partial r} = -\frac{q}{4\pi\varepsilon_0} \left( \frac{1}{r} - \frac{1}{r_b} \right) = \frac{1}{4\pi\varepsilon_0} \frac{q}{r^2} = \frac{V_{ab}}{r^2}. \]

5. **(d) From Eq. (23.23):** \( E = 0 \), since \( V \) is constant (zero) outside the spheres.

6. **(e) If the outer charge is different, then outside the outer sphere the potential is no longer zero but is**

\[ V = \frac{1}{4\pi\varepsilon_0} \frac{q}{r} - \frac{1}{4\pi\varepsilon_0} \frac{Q}{r} = \frac{1}{4\pi\varepsilon_0} \frac{(q - Q)}{r}. \] All potentials inside the outer shell are just shifted by an amount \( V = \frac{1}{4\pi\varepsilon_0} \frac{Q}{r_b} \). Therefore relative potentials within the shells are not affected. Thus (b) and (c) do not change. However, now that the potential does vary outside the spheres, there is an electric field there:

\[ E = -\frac{\partial V}{\partial r} = -\frac{\partial}{\partial r} \left( \frac{kq}{r} - \frac{kQ}{r} \right) = kq \left( \frac{q}{r} - \frac{Q}{r} \right) = kq \left( \frac{1}{r} - \frac{1}{r_b} \right) = \frac{k}{r^2} (q - Q). \]

**Evaluate:** In part (a) the potential is greater than zero for all \( r < r_b \).

### 23.48

**Identify:** Exercise 23.47 shows that \( V = kq \left( \frac{1}{r} - \frac{1}{r_b} \right) \) for \( r < r_a \), \( V = kq \left( \frac{1}{r} - \frac{1}{r_b} \right) \) for \( r_a < r < r_b \), and \( V_{ab} = kq \left( \frac{1}{r_a} - \frac{1}{r_b} \right) \).

**Set Up:** \( E = \frac{kq}{r^2} \), radially outward, for \( r_a \leq r \leq r_b \).

**Execute:** (a) \( V_{ab} = kq \left( \frac{1}{r_a} - \frac{1}{r_b} \right) = 500 \text{ V gives } q = \frac{500 \text{ V}}{\frac{1}{0.012 \text{ m}} - \frac{1}{0.096 \text{ m}}} = 7.62 \times 10^{-10} \text{ C.} \)
23-20  Chapter 23

(b) \( V_b = 0 \) so \( V_a = 500 \) V. The inner metal sphere is an equipotential with \( V = 500 \) V. 
\[
\frac{1}{r} = \frac{1}{r_o} + \frac{V}{kq}
\]
\( V = 400 \) V at \( r = 1.45 \) cm, \( V = 300 \) V at \( r = 1.85 \) cm, \( V = 200 \) V at \( r = 2.53 \) cm, \( V = 100 \) V at \( r = 4.00 \) cm, \( V = 0 \) at \( r = 9.60 \) cm. The equipotential surfaces are sketched in Figure 23.48.

**Evaluate:** (e) The equipotential surfaces are concentric spheres and the electric field lines are radial, so the field lines and equipotential surfaces are mutually perpendicular. The equipotentials are closest at smaller \( r \), where the electric field is largest.

![Figure 23.48](image-url)

23.49. **Identify:** Outside the cylinder it is equivalent to a line of charge at its center.

**Set Up:** The difference in potential between the surface of the cylinder (a distance \( R \) from the central axis) and a general point a distance \( r \) from the central axis is given by \( \Delta V = \frac{\lambda}{2\pi\varepsilon_0} \ln(r/R) \).

**Execute:** (a) The potential difference depends only on \( r \), and not direction. Therefore all points at the same value of \( r \) will be at the same potential. Thus the equipotential surfaces are cylinders coaxial with the given cylinder.

(b) Solving \( \Delta V = \frac{\lambda}{2\pi\varepsilon_0} \ln(r/R) \) for \( r \), gives \( r = Re^{\pi\varepsilon_0\Delta V/\lambda} \).

For 10 V, the exponent is \( (10 \text{ V})/(2 \times 9.00 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(1.50 \times 10^{-9} \text{ C/m}) \) = 0.370, which gives \( r = (2.00 \text{ cm})e^{0.370} = 2.90 \) cm. Likewise, the other radii are 4.20 cm (for 20 V) and 6.08 cm (for 30 V).

(c) \( \Delta r_1 = 2.90 \text{ cm} - 2.00 \text{ cm} = 0.90 \text{ cm} \); \( \Delta r_2 = 4.20 \text{ cm} - 2.90 \text{ cm} = 1.30 \text{ cm} \); \( \Delta r_3 = 6.08 \text{ cm} - 4.20 \text{ cm} = 1.88 \text{ cm} \).

**Evaluate:** As we can see, \( \Delta r \) increases, so the surfaces get further apart. This is very different from a sheet of charge, where the surfaces are equally spaced planes.

23.50. **Identify:** As the sphere approaches the point charge, the speed of the sphere decreases because it loses kinetic energy, but its acceleration increases because the electric force on it increases. Its mechanical energy is conserved during the motion, and Newton’s second law and Coulomb’s law both apply.

**Set Up:** \( K_a + U_a = K_b + U_b \), \( K = \frac{1}{2}mv^2 \), \( U = kq_1q_2/r \), \( F = kq_1q_2/r^2 \), and \( F = ma \).

**Execute:** Find the distance between the two charges when \( v_2 = 25.0 \text{ m/s} \).

\[
K_a + U_a = K_b + U_b \\
K_a = \frac{1}{2}mv_a^2 = \frac{1}{2}(4.00 \times 10^{-3} \text{ kg})(40.0 \text{ m/s})^2 = 3.20 \text{ J} \]

\[
K_b = \frac{1}{2}mv_b^2 = \frac{1}{2}(4.00 \times 10^{-3} \text{ kg})(25.0 \text{ m/s})^2 = 1.25 \text{ J} \]

© Copyright 2012 Pearson Education, Inc. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.
\[ U_a = k \frac{q_1 q_2}{r_{a2}} = \frac{(8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(5.00 \times 10^{-6} \text{ C})(5.00 \times 10^{-6} \text{ C})}{0.0600 \text{ m}} = 1.498 \text{ J}. \]

\[ U_b = K_a + U_a - K_b = 3.20 \text{ J} + 1.498 \text{ J} - 1.25 \text{ J} = 3.448 \text{ J}. \]

\[ U_b = k \frac{q_1 q_2}{r_{b2}} \quad \text{and} \quad r_{b2} = \frac{(8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(5.00 \times 10^{-6} \text{ C})(2.00 \times 10^{-6} \text{ C})}{3.448 \text{ J}} = 0.02607 \text{ m}. \]

\[ F_b = k \frac{q_1 q_2}{r_{b2}^2} = \frac{(8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(5.00 \times 10^{-6} \text{ C})(2.00 \times 10^{-6} \text{ C})}{(0.02607 \text{ m})^2} = 132.3 \text{ N}. \]

\[ a = \frac{F}{m} = \frac{132.3 \text{ N}}{4.00 \times 10^{-3} \text{ kg}} = 3.31 \times 10^4 \text{ m/s}^2. \]

**EVALUATE:** As the sphere approaches the point charge, its speed decreases but its acceleration keeps increasing because the electric force on it keeps increasing.

### 23.51.

**IDENTIFY:** \( U = k \left( \frac{q_1 q_2}{r_{12}} + \frac{q_1 q_3}{r_{13}} + \frac{q_2 q_3}{r_{23}} \right) \)

**SET UP:** In part (a), \( r_{12} = 0.200 \text{ m}, \)
\( r_{13} = 0.100 \text{ m} \) and \( r_{13} = 0.100 \text{ m}. \) In part (b) let particle 3 have coordinate \( x \), so \( r_{12} = 0.200 \text{ m}, \)
\( r_{13} = x \) and \( r_{23} = 0.200 - x \).

**EXECUTE:** (a) \( U = k \left( \frac{(4.00 \text{ nC})(-3.00 \text{ nC})}{(0.200 \text{ m})} + \frac{(4.00 \text{ nC})(2.00 \text{ nC})}{(0.100 \text{ m})} + \frac{(-3.00 \text{ nC})(2.00 \text{ nC})}{(0.100 \text{ m})} \right) = -3.60 \times 10^{-7} \text{ J} \)

(b) If \( U = 0 \), then \( 0 = k \left( \frac{q_1 q_2}{r_{12}} + \frac{q_1 q_3}{x} + \frac{q_2 q_3}{r_{13}} \right). \) Solving for \( x \) we find:

\[ 0 = -60 + \frac{8}{x} \Rightarrow 60x^2 - 26x + 1.6 = 0 \Rightarrow x = 0.074 \text{ m}, 0.360 \text{ m}. \]

Therefore, \( x = 0.074 \text{ m} \) since it is the only value between the two charges.

**EVALUATE:** \( U_{13} \) is positive and both \( U_{23} \) and \( U_{12} \) are negative. If \( U = 0 \), then \( |U_{13}| = |U_{23}| + |U_{12}| \). For \( x = 0.074 \text{ m}, \)
\( U_{13} = +9.7 \times 10^{-7} \text{ J}, \)
\( U_{23} = -4.3 \times 10^{-7} \text{ J} \) and \( U_{12} = -5.4 \times 10^{-7} \text{ J} \). It is true that \( U = 0 \) at this \( x \).

### 23.52.

**IDENTIFY:** Two forces do work on the sphere as it falls: gravity and the electrical force due to the sheet. The energy of the sphere is conserved.

**SET UP:** The gravity force is \( mg \), downward. The electric field of the sheet is \( E = \frac{\sigma}{2 \varepsilon_0} \) upward, and the force it exerts on the sphere is \( F = qE \). The sphere gains kinetic energy \( K = \frac{1}{2}mv^2 \) as it falls.

**EXECUTE:** \( mg = 4.90 \times 10^{-6} \text{ N}. \)

\[ E = \frac{\sigma}{2 \varepsilon_0} = \frac{8.00 \times 10^{-12} \text{ C/m}^2}{2(8.854 \times 10^{-12} \text{ C}^2/(\text{N} \cdot \text{m}^2))} = 0.4518 \text{ N/C}. \]

The electric force is \( qE = (3.00 \times 10^{-6} \text{ C})(0.4518 \text{ N/C}) = 1.355 \times 10^{-6} \text{ N}, \) upward. The net force is downward, so the sphere moves downward when released. Let \( y = 0 \) at the sheet. \( U_{\text{grav}} = mg \). \( U_{\text{grav}} = \frac{W}{q} \). Let point \( a \) be at the sheet and let point \( b \) be a distance \( y \) above the sheet. Take \( V_a = 0 \). The force on \( q \) is \( qE \), upward, so \( \frac{W_{a \to b}}{q} = Ey \) and \( V_b = -Ey \). \( U_b = 0. \)

\[ y_1 = 0.400 \text{ m}, \quad y_2 = 0.100 \text{ m}. \]

\[ K_1 = \frac{1}{2}mv_1^2 = \frac{1}{2}(4.00 \times 10^{-3} \text{ kg})(9.8 \text{ m/s}^2)(0.300 \text{ m}) = 0.588 \text{ J}. \]

\[ K_2 = (5.00 \times 10^{-7} \text{ kg})(9.8 \text{ m/s}^2)(0.300 \text{ m}) = 0.4518 \text{ N/C}(0.300 \text{ m})(0.300 \text{ m})(0.300 \text{ m})(3.00 \times 10^{-6} \text{ C}). \]
\[ K_2 = 1.470 \times 10^{-6} \text{ J} - 0.407 \times 10^{-6} \text{ J} = 1.063 \times 10^{-6} \text{ J}. \quad K_2 = \frac{1}{2} m v_2^2 \] 

so

\[ v_2 = \sqrt{\frac{2K_2}{m}} = \sqrt{\frac{2(1.063 \times 10^{-6} \text{ J})}{5.00 \times 10^{-7} \text{ kg}}} = 2.06 \text{ m/s}. \]

**Evaluate:** Because the weight is greater than the electric force, the sphere will accelerate downward, but if it were light enough the electric force would exceed the weight. In that case it would never get closer to the sheet after being released.

23.53. **Identify:** The remaining nucleus (radium minus the ejected alpha particle) repels the alpha particle, giving it 4.79 MeV of kinetic energy when it is far from the nucleus. The mechanical energy of the system is conserved.

**Set up:** \( U = k \frac{q \tilde{q}'}{r}, \quad U_a + K_a = U_b + K_b. \) The charge of the alpha particle is \( +2e \) and the charge of the radon nucleus is \( +86e. \)

**Execute:** (a) The final energy of the alpha particle, 4.79 MeV, equals the electrical potential energy of the alpha-radon combination just before the decay. \( U = 4.79 \text{ MeV} = 7.66 \times 10^{-13} \text{ J}. \)

(b) \( r = \frac{kqq'}{U} = \frac{(8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(2)(86)(1.60 \times 10^{-19} \text{ C})^2}{7.66 \times 10^{-13} \text{ J}} = 5.17 \times 10^{-14} \text{ m}. \)

**Evaluate:** Although we have made some simplifying assumptions (such as treating the atomic nucleus as a spherically symmetric charge, even when very close to it), this result gives a fairly reasonable estimate for the size of a nucleus.

23.54. **Identify:** The charged particles repel each other and therefore accelerate away from one another, causing their speeds and kinetic energies to continue to increase. They do not have equal speeds because they have different masses. The mechanical energy and momentum of the system are conserved.

**Set up:** The proton has charge \( q_p = +e \) and mass \( m_p = 1.67 \times 10^{-27} \text{ kg}. \) The alpha particle has charge \( q_\alpha = +4e \) and mass \( m_\alpha = 4m_p = 6.68 \times 10^{-27} \text{ kg}. \) We can apply both conservation of energy and conservation of linear momentum to the system. \( a = \frac{F}{m}, \) where \( F = k \frac{|q|q'}{r^2}. \)

**Execute:** **Acceleration:** The maximum force and hence the maximum acceleration occurs just after they are released, when \( r = 0.225 \text{ nm}. \) \( F = \frac{kqq'}{r^2} = \frac{(8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(2)(1.60 \times 10^{-19} \text{ C})^2}{(0.225 \times 10^{-9} \text{ m})^2} = 9.09 \times 10^9 \text{ N}. \)

\[ a_p = \frac{F}{m_p} = \frac{9.09 \times 10^9 \text{ N}}{1.67 \times 10^{-27} \text{ kg}} = 5.44 \times 10^{18} \text{ m/s}^2; \quad a_\alpha = \frac{F}{m_\alpha} = \frac{9.09 \times 10^9 \text{ N}}{6.68 \times 10^{-27} \text{ kg}} = 1.36 \times 10^{18} \text{ m/s}^2. \]

The acceleration of the proton is larger by a factor of \( m_\alpha/m_p. \)

**Speed:** Conservation of energy says \( U_1 + K_1 = U_2 + K_2. \) \( K_1 = 0 \) and \( U_2 = 0, \) so \( K_2 = U_1. \)

\[ U_1 = k \frac{qq'}{r} = \frac{(8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(2)(1.60 \times 10^{-19} \text{ C})^2}{(0.225 \times 10^{-9} \text{ m})} = 2.05 \times 10^{-18} \text{ J}, \]

so the total kinetic energy of the two particles when they are far apart is \( K_2 = 2.05 \times 10^{-18} \text{ J}. \) Conservation of linear momentum says how this energy is divided between the proton and alpha particle: \( p_1 = p_2. \) \( 0 = m_p v_p - m_\alpha v_\alpha \) so \( v_\alpha = \left(\frac{m_p}{m_\alpha}\right) v_p. \)

\[ K_2 = \frac{1}{2} m_p v_p^2 + \frac{1}{2} m_\alpha v_\alpha^2 = \frac{1}{2} m_p v_p^2 + \frac{1}{2} m_\alpha \left(\frac{m_p}{m_\alpha}\right)^2 v_p^2 = \frac{1}{2} m_p v_p^2 \left(1 + \frac{m_p}{m_\alpha}\right). \]

\[ v_p = \sqrt{\frac{2K}{m_p(1 + (m_p/m_\alpha))}} = \sqrt{\frac{2(2.05 \times 10^{-18} \text{ J})}{(1.67 \times 10^{-27} \text{ kg})(1 + \frac{1}{4})}} = 4.43 \times 10^4 \text{ m/s}. \]

© Copyright 2012 Pearson Education, Inc. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.
$$v_a = \left( \frac{m_p}{m_a} \right) v_p = \frac{1}{4}(4.43 \times 10^4 \text{ m/s}) = 1.11 \times 10^4 \text{ m/s}.$$ The maximum acceleration occurs just after they are released. The maximum speed occurs after a long time.

**EVALUATE:** The proton and alpha particle have equal momentum, but proton has a greater acceleration and more kinetic energy.

23.55. (a) **IDENTIFY:** Apply the work-energy theorem, Eq. (6.6).

**SET UP:** Points $a$ and $b$ are shown in Figure 23.55a.

$$v_a = 0 \quad \begin{array}{c} E \end{array} \quad 8.00 \text{ cm} \quad b$$

**Figure 23.55a**

**EXECUTE:** $$W_{\text{tot}} = \Delta K = K_b - K_a = K_b = 4.35 \times 10^{-5} \text{ J}$$

The electric force $F_E$ and the additional force $F$ both do work, so that $W_{\text{tot}} = W_{F_E} + W_F$.

$$W_{F_E} = W_{\text{tot}} - W_F = 4.35 \times 10^{-5} \text{ J} - 6.50 \times 10^{-5} \text{ J} = -2.15 \times 10^{-5} \text{ J}$$

**EVALUATE:** The forces on the charged particle are shown in Figure 23.55b.

$$\begin{array}{c} F_E \end{array} \quad q \quad F$$

**Figure 23.55b**

The electric force is to the left (in the direction of the electric field since the particle has positive charge). The displacement is to the right, so the electric force does negative work. The additional force $F$ is in the direction of the displacement, so it does positive work.

(b) **IDENTIFY** and **SET UP:** For the work done by the electric force, $W_{a\rightarrow b} = q(V_a - V_b)$.

**EXECUTE:** $$V_a - V_b = \frac{W_{a\rightarrow b}}{q} = \frac{-2.15 \times 10^{-5} \text{ J}}{7.60 \times 10^{-9} \text{ C}} = -2.83 \times 10^3 \text{ V}.$$  

**EVALUATE** The starting point (point $a$) is at $2.83 \times 10^3$ V lower potential than the ending point (point $b$). We know that $V_b > V_a$ because the electric field always points from high potential toward low potential.

(c) **IDENTIFY:** Calculate $E$ from $V_a - V_b$ and the separation $d$ between the two points.

**SET UP:** Since the electric field is uniform and directed opposite to the displacement $W_{a\rightarrow b} = -F_E d = -qEd$, where $d = 8.00 \text{ cm}$ is the displacement of the particle.

**EXECUTE:** $$E = \frac{W_{a\rightarrow b}}{qd} = \frac{V_a - V_b}{d} = \frac{-2.83 \times 10^3 \text{ V}}{0.0800 \text{ m}} = 3.54 \times 10^4 \text{ V/m}.$$  

**EVALUATE:** In part (a), $W_{\text{tot}}$ is the total work done by both forces. In parts (b) and (c) $W_{a\rightarrow b}$ is the work done just by the electric force.

23.56. **IDENTIFY:** The electric force between the electron and proton is attractive and has magnitude $F = \frac{k e^2}{r^2}$.

For circular motion the acceleration is $a_{\text{end}} = v^2/r$. $U = -\frac{k e^2}{r}$.

**SET UP:** $e = 1.60 \times 10^{-19}$ C. 1 eV = $1.60 \times 10^{-19}$ J.

**EXECUTE:** (a) $\frac{m v^2}{r} = \frac{k e^2}{r^2}$ and $v = \sqrt{\frac{k e^2}{m r}}$. 

© Copyright 2012 Pearson Education, Inc. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.
23.57. **Identify and Set Up:** Calculate the components of $\vec{E}$ from Eq. (23.19). Eq. (21.3) gives $\vec{F}$ from $\vec{E}$.

**Execute:**

(a) $V = Ce^{4/3}$

$$C = \frac{1}{2} \frac{m v^2}{2} = \frac{1}{2} \frac{ke^2}{2} = -\frac{1}{2} U$$

$$E = K + U = \frac{1}{2} \frac{m v^2}{2} = -\frac{1}{2} \frac{ke^2}{2} = -\frac{1}{2} \frac{k(1.60 \times 10^{-19} \text{ C})^2}{2 \times 5.29 \times 10^{-11} \text{ m}} = -2.17 \times 10^{-18} \text{ J} = -13.6 \text{ eV}.$$  

**Evaluate:** The total energy is negative, so the electron is bound to the proton. Work must be done on the electron to take it far from the proton.

(b) $E_x = -\frac{\partial V}{\partial x} = -\frac{4}{3} C x^{1/3} = -(1.05 \times 10^5 \text{ V/m}^{4/3}) x^{1/3}$

The minus sign means that $E_x$ is in the $-x$-direction, which says that $\vec{E}$ points from the positive anode toward the negative cathode.

(c) $\vec{F} = q \vec{E}$ so $F_x = -eE_x = \frac{4}{3} eC x^{1/3}$

Halfway between the electrodes means $x = 6.50 \times 10^{-3} \text{ m}$.

$$F_x = \frac{4}{3} (1.602 \times 10^{-19} \text{ C})(7.85 \times 10^4 \text{ V/m}^{4/3})(6.50 \times 10^{-3} \text{ m})^{1/3} = 3.13 \times 10^{-15} \text{ N}$$

$F_x$ is positive, so the force is directed toward the positive anode.

**Evaluate:** $V$ depends only on $x$, so $E_y = E_z = 0$. $\vec{E}$ is directed from high potential (anode) to low potential (cathode). The electron has negative charge, so the force on it is directed opposite to the electric field.

23.58. **Identify:** At each point (a and b), the potential is the sum of the potentials due to both spheres. The voltmeter reads the difference between these two potentials. The spheres behave like point charges since the meter is connected to the surface of each one.

**Set Up:** (a) Call $a$ the point on the surface of one sphere and $b$ the point on the surface of the other sphere, call $r$ the radius of each sphere and call $d$ the center-to-center distance between the spheres. The potential difference $V_{ba}$ between points $a$ and $b$ is then

$$V_b - V_a = V_{ba} = \frac{1}{4 \pi \varepsilon_0} \left[ -\frac{q}{r} + \frac{q}{d-r} - \left( \frac{q}{r} - \frac{q}{d-r} \right) \right] = \frac{2q}{4 \pi \varepsilon_0} \left( \frac{1}{d-r} - \frac{1}{r} \right).$$

**Execute:** Substituting the numbers gives

$$V_b - V_a = 2(250 \mu \text{C}) (9.00 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2) \left[ \frac{1}{0.750 \text{ m}} - \frac{1}{0.250 \text{ m}} \right] = -12.0 \times 10^6 \text{ V}. \text{ The meter reads } 12.0 \text{ MV}.$$  

(b) Since $V_b - V_a$ is negative, $V_a > V_b$, so point $a$ is at the higher potential.

**Evaluate:** An easy way to see that the potential at $a$ is higher than the potential at $b$ is that it would require positive work to move a positive test charge from $b$ to $a$ since this charge would be attracted by the negative sphere and repelled by the positive sphere.

23.59. **Identify:** $U = \frac{k q_1 q_2}{r}$

**Set Up:** Eight charges means there are $8(8-1)/2 = 28$ pairs. There are 12 pairs of $q$ and $-q$ separated by $d$, 12 pairs of equal charges separated by $\sqrt{2}d$ and 4 pairs of $q$ and $-q$ separated by $\sqrt{3}d$.

**Execute:** (a) $U = \frac{k q^2}{d} \left( \frac{12}{d} + \frac{12}{\sqrt{2}d} - \frac{4}{\sqrt{3}d} \right) = \frac{12kq^2}{d} \left( 1 - \frac{1}{\sqrt{2}} + \frac{1}{3\sqrt{3}} \right) = -1.46q^2/\pi \varepsilon_0 d$

**Evaluate:** (b) The fact that the electric potential energy is less than zero means that it is energetically favorable for the crystal ions to be together.
23.60. **IDENTIFY:** For two small spheres, \( U = \frac{kq_1q_2}{r} \). For part (b) apply conservation of energy.

**SET UP:** Let \( q_1 = 2.00 \, \mu \text{C} \) and \( q_2 = -3.50 \, \mu \text{C} \). Let \( r_2 = 0.250 \, \text{m} \) and \( r_3 \to \infty \).

**EXECUTE:**
(a) \( U = \frac{(8.99 \times 10^9 \, \text{N} \cdot \text{m}^2/\text{C}^2)(2.00 \times 10^{-6} \, \text{C})(-3.50 \times 10^{-6} \, \text{C})}{0.250 \, \text{m}} = -0.252 \, \text{J} \)

(b) \( K_b = 0 \), \( U_b = 0 \). \( U_a = -0.252 \, \text{J} \). \( K_a + U_a = K_b + U_b \) gives \( K_a = 0.252 \, \text{J} \). \( K_a = \frac{1}{2}mv_a^2 \), so

\[ v_a = \sqrt{\frac{2K_a}{m}} = \sqrt{\frac{2(0.252 \, \text{J})}{1.50 \times 10^{-3} \, \text{kg}}} = 18.3 \, \text{m/s} \]

**EVALUATE:** As the sphere moves away, the attractive electrical force exerted by the other sphere does negative work and removes all the kinetic energy it initially had. Note that it doesn’t matter which sphere is held fixed and which is shot away; the answer to part (b) is unaffected.

23.61. (a) **IDENTIFY:** Use Eq. (23.10) for the electron and each proton.

**SET UP:** The positions of the particles are shown in Figure 23.61a.

\[ r = (1.07 \times 10^{-10} \, \text{m})/2 = 0.535 \times 10^{-10} \, \text{m} \]

**EXECUTE:** The potential energy of interaction of the electron with each proton is \( U = \frac{1}{4\pi \varepsilon_0} \frac{(-e)^2}{r} \), so the total potential energy is

\[ U = \frac{2e^2}{4\pi \varepsilon_0 r} = \frac{2(8.988 \times 10^9 \, \text{N} \cdot \text{m}^2/\text{C}^2)(1.60 \times 10^{-19} \, \text{C})^2}{0.535 \times 10^{-10} \, \text{m}} = -8.60 \times 10^{-18} \, \text{J} \]

\[ U = -8.60 \times 10^{-18} \, \text{J} = (1 \, \text{eV}/1.602 \times 10^{-19} \, \text{J}) = -53.7 \, \text{eV} \]

**EVALUATE:** The electron and proton have charges of opposite signs, so the potential energy of the system is negative.

(b) **IDENTIFY** and **SET UP:** The positions of the protons and points \( a \) and \( b \) are shown in Figure 23.61b.

\[ r_b = \sqrt{a^2 + d^2} \]

\[ r_a = \sqrt{0.535 \times 10^{-10} \, \text{m}} \]

Apply \( K_a + U_a + W_{\text{other}} = K_b + U_b \) with point \( a \) midway between the protons and point \( b \) where the electron instantaneously has \( v = 0 \) (at its maximum displacement \( d \) from point \( a \)).

**EXECUTE:** Only the Coulomb force does work, so \( W_{\text{other}} = 0 \).

\[ U_a = -8.60 \times 10^{-18} \, \text{J} \] (from part (a))

\[ K_a = \frac{1}{2}mv_a^2 = \frac{1}{2}(0.109 \times 10^{-31} \, \text{kg})(1.50 \times 10^6 \, \text{m/s})^2 = 1.025 \times 10^{-18} \, \text{J} \]

\[ K_b = 0 \]

\[ U_b = -2ke^2/r_b \]

Then \( U_b = K_b + U_b - K_a = 1.025 \times 10^{-18} \, \text{J} - 8.60 \times 10^{-18} \, \text{J} = -7.575 \times 10^{-18} \, \text{J} \).
\[ \eta_b = -\frac{2ke^2}{U_b} = -\frac{2(8.988 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(1.60 \times 10^{-19} \text{ C})^2}{-7.575 \times 10^{-18} \text{ J}} = 6.075 \times 10^{-11} \text{ m} \]

Then \( d = \sqrt{\eta_b^2 - \eta_0^2} = \sqrt{(6.075 \times 10^{-11} \text{ m})^2 - (5.35 \times 10^{-11} \text{ m})^2} = 2.88 \times 10^{-11} \text{ m} \).

**EVALUATE:** The force on the electron pulls it back toward the midpoint. The transverse distance the electron moves is about 0.27 times the separation of the protons.

23.62. **IDENTIFY:** Apply \( \sum F_x = 0 \) and \( \sum F_y = 0 \) to the sphere. The electric force on the sphere is \( F_e = qE \). The potential difference between the plates is \( V = Ed \).

**SET UP:** The free-body diagram for the sphere is given in Figure 23.62.

**EXECUTE:** \( T \cos \theta = mg \) and \( T \sin \theta = F_e \) gives

\[ F_e = mg \tan \theta = (1.50 \times 10^{-3} \text{ kg})(9.80 \text{ m/s}^2)\tan(30^\circ) = 0.0085 \text{ N} \]

\[ F_e = E \frac{Vq}{d} \quad \text{and} \quad V = \frac{Fd}{q} = \frac{(0.0085 \text{ N})(0.0500 \text{ m})}{8.90 \times 10^{-6} \text{ C}} = 47.8 \text{ V} \]

**EVALUATE:** \( E = V/d = 956 \text{ V/m} \), \( E = \sigma \epsilon_0 \) and \( \sigma = E \epsilon_0 = 8.46 \times 10^{-9} \text{ C/m}^2 \).

![Figure 23.62](image)

23.63. **(a) IDENTIFY:** The potential at any point is the sum of the potentials due to each of the two charged conductors.

**SET UP:** From Example 23.10, for a conducting cylinder with charge per unit length \( \lambda \), the potential outside the cylinder is given by \( V = (\lambda/2\pi \epsilon_0) \ln(r_0/r) \) where \( r \) is the distance from the cylinder axis and \( r_0 \) is the distance from the axis for which we take \( V = 0 \). Inside the cylinder the potential has the same value as on the cylinder surface. The electric field is the same for a solid conducting cylinder or for a hollow conducting tube so this expression for \( V \) applies to both. This problem says to take \( r_0 = b \).

**EXECUTE:** For the hollow tube of radius \( b \) and charge per unit length \( -\lambda \): outside \( V = -(\lambda/2\pi \epsilon_0) \ln(b/r) \); inside \( V = 0 \) since \( V = 0 \) at \( r = b \).

For the metal cylinder of radius \( a \) and charge per unit length \( \lambda \):

outside \( V = (\lambda/2\pi \epsilon_0) \ln(b/a) \), inside \( V = (\lambda/2\pi \epsilon_0) \ln(b/a) \), the value at \( r = a \).

(i) \( r < a \); inside both \( V = (\lambda/2\pi \epsilon_0) \ln(b/a) \)

(ii) \( a < r < b \); outside cylinder, inside tube \( V = (\lambda/2\pi \epsilon_0) \ln(b/r) \)

(iii) \( r > b \); outside both the potentials are equal in magnitude and opposite in sign so \( V = 0 \).

**(b) For** \( r = a \), \( V_a = (\lambda/2\pi \epsilon_0) \ln(b/a) \).

For \( r = b \), \( V_b = 0 \).

Thus \( V_{ab} = V_a - V_b = (\lambda/2\pi \epsilon_0) \ln(b/a) \).

**Identify and Set Up:** Use Eq. (23.23) to calculate \( E \).

**Execute:** \( E = -\frac{\Delta V}{\Delta r} = -\frac{\lambda}{2\pi \epsilon_0} \frac{d}{dr} \ln \left( \frac{b}{r} \right) = -\frac{\lambda}{2\pi \epsilon_0} \left( \frac{b}{r^2} \right) \ln(b/a) \cdot \frac{1}{r} \)

**Evaluate:** The electric field between the cylinders is due only to the inner cylinder, so \( V_{ab} \) is not changed, \( V_{ab} = (\lambda/2\pi \epsilon_0) \ln(b/a) \).

**EVALUATE:** The electric field is not uniform between the cylinders, so \( V_{ab} \neq E(b-a) \).
23.64. **IDENTIFY**: The wire and hollow cylinder form coaxial cylinders. Problem 23.63 gives \( E(r) = \frac{V_{ab}}{\ln(b/a)} \frac{1}{r} \).

**SET UP**: \( a = 145 \times 10^{-6} \text{ m}, \ b = 0.0180 \text{ m} \).

**EXECUTE**: \( E = \frac{V_{ab}}{\ln(b/a)} \frac{1}{r} \) and

\[
V_{ab} = E \ln(b/a) = (2.00 \times 10^4 \text{ N/C})(\ln(0.018 \text{ m}/145 \times 10^{-6} \text{ m})))0.012 \text{ m} = 1157 \text{ V}.
\]

**EVALUATE**: The electric field at any \( r \) is directly proportional to the potential difference between the wire and the cylinder.

23.65. **IDENTIFY and SET UP**: Use Eq. (21.3) to calculate \( \vec{F} \) and then \( \vec{F} = m \vec{a} \) gives \( \vec{a} \). \( E = dV/d \).

**EXECUTE**: (a) \( \vec{F}_E = q \vec{E} \). Since \( q = -e \) is negative \( \vec{F}_E \) and \( \vec{E} \) are in opposite directions; \( \vec{E} \) is upward so \( \vec{F}_E \) is downward. The magnitude of \( E \) is \( E = \frac{V}{d} = \frac{22.0 \text{ V}}{0.0200 \text{ m}} = 1.10 \times 10^3 \text{ V/m} = 1.10 \times 10^3 \text{ N/C} \). The magnitude of \( F_E \) is \( F_E = |q|E = eE = (1.602 \times 10^{-19} \text{ C})(1.10 \times 10^3 \text{ N/C}) = 1.76 \times 10^{-16} \text{ N} \).

(b) Calculate the acceleration of the electron produced by the electric force:

\[ a = \frac{\vec{F}}{m} = \frac{1.76 \times 10^{-16} \text{ N}}{9.109 \times 10^{-31} \text{ kg}} = 1.93 \times 10^{14} \text{ m/s}^2. \]

**EVALUATE**: This acceleration is much larger than \( g = 9.80 \text{ m/s}^2 \), so the gravity force on the electron can be neglected. \( \vec{F}_E \) is downward, so \( \vec{a} \) is downward.

(e) **IDENTIFY and SET UP**: The acceleration is constant and downward, so the motion is like that of a projectile. Use the horizontal motion to find the time and then use the time to find the vertical displacement.

**EXECUTE**: \( x \)-component: \( \vec{v}_{0x} = 6.50 \times 10^6 \text{ m/s}; \ \vec{a}_x = 0; \ x - x_0 = 0.060 \text{ m}; \ t = ? \)

\[
x - x_0 = v_{0x}t + \frac{1}{2}a_xt^2 \text{ and the } a_x \text{ term is zero, so } t = \frac{x - x_0}{v_{0x}} = \frac{0.060 \text{ m}}{6.50 \times 10^6 \text{ m/s}} = 9.231 \times 10^{-9} \text{ s}.
\]

\( y \)-component: \( \vec{v}_{0y} = 0; \ \vec{a}_y = 1.93 \times 10^{14} \text{ m/s}^2; \ t = 9.231 \times 10^{-9} \text{ m/s}; \ y - y_0 = ? \)

\[
y - y_0 = v_{0y}t + \frac{1}{2}a_yt^2. \ y - y_0 = \frac{1}{2}(1.93 \times 10^{14} \text{ m/s}^2)(9.231 \times 10^{-9} \text{ s})^2 = 0.00822 \text{ m} = 0.822 \text{ cm}.
\]

(d) The velocity and its components as the electron leaves the plates are sketched in Figure 23.65.

\[ v_x = v_{0x} = 6.50 \times 10^6 \text{ m/s (since } a_x = 0) \]

\[ v_y = v_{0y} + a_yt \]

\[ v_y = 0 + (1.93 \times 10^{14} \text{ m/s}^2)(9.231 \times 10^{-9} \text{ s}) \]

\[ v_y = 1.782 \times 10^6 \text{ m/s} \]

\[
\tan\alpha = \frac{v_y}{v_x} = \frac{1.782 \times 10^6 \text{ m/s}}{6.50 \times 10^6 \text{ m/s}} = 0.2742 \text{ so } \alpha = 15.3^\circ.
\]

**EVALUATE**: The greater the electric field or the smaller the initial speed the greater the downward deflection.

(e) **IDENTIFY and SET UP**: Consider the motion of the electron after it leaves the region between the plates. Outside the plates there is no electric field, so \( a = 0 \). (Gravity can still be neglected since the electron is traveling at such high speed and the times are small.) Use the horizontal motion to find the time it takes the electron to travel 0.120 m horizontally to the screen. From this time find the distance downward that the electron travels.

\[
\tan\alpha = \frac{v_y}{v_x} = \frac{1.782 \times 10^6 \text{ m/s}}{6.50 \times 10^6 \text{ m/s}} = 0.2742 \text{ so } \alpha = 15.3^\circ.
\]

**EVALUATE**: The greater the electric field or the smaller the initial speed the greater the downward deflection.
Execute: \( x \)-component: \( v_{0x} = 6.50 \times 10^6 \text{ m/s}; \ a_x = 0; \ x-x_0 = 0.120 \text{ m}; \ t = ? \)

\[ x-x_0 = v_{0x} t + \frac{1}{2} a_x t^2 \]

and the \( a_x \) term is term is zero, so

\[ t = \frac{x-x_0}{v_{0x}} = \frac{0.120 \text{ m}}{6.50 \times 10^6 \text{ m/s}} = 1.846 \times 10^{-8} \text{ s}. \]

\( y \)-component: \( v_{0y} = 1.782 \times 10^6 \text{ m/s} \) (from part (b)); \( a_y = 0 \); \( t = 1.846 \times 10^{-8} \text{ m/s}; \ y-y_0 = ? \)

\[ y-y_0 = v_{0y} t + \frac{1}{2} a_y t^2 = (1.782 \times 10^6 \text{ m/s})(1.846 \times 10^{-8} \text{ s}) = 0.0329 \text{ m} = 3.29 \text{ cm}. \]

Evaluate: The electron travels downward a distance 0.822 cm while it is between the plates and a distance 3.29 cm while traveling from the edge of the plates to the screen. The total downward deflection is 0.822 cm + 3.29 cm = 4.11 cm. The horizontal distance between the plates is half the horizontal distance the electron travels after it leaves the plates. And the vertical velocity of the electron increases as it travels between the plates, so it makes sense for it to have greater downward displacement during the motion after it leaves the plates.

23.66. Identify: The charge on the plates and the electric field between them depend on the potential difference across the plates.

(a) Set up: For two parallel plates, the potential difference between them is \( V = Ed = \frac{\sigma d}{\epsilon_0} = \frac{Qd}{\epsilon_0 A} \).

Execute: Solving for \( Q \) gives \( Q = \epsilon_0 A V \cdot d = \frac{(8.85 \times 10^{-12} \text{ C}^2/\text{N} \cdot \text{m}^2)(0.050 \text{ m})^2(25.0 \text{ V})}{0.0050 \text{ m}} \).

\( Q = 3.98 \times 10^{-11} \text{ C} = 39.8 \text{ pC}. \)

(b) \( E = V/d = (25.0 \text{ V})/(0.0050 \text{ m}) = 5.00 \times 10^3 \text{ V/m}. \)

(c) Set up: Energy conservation gives \( \frac{1}{2}mv^2 = eV \).

Execute: Solving for \( v \) gives \( v = \sqrt{2eV/m} = \sqrt{\frac{2(1.60 \times 10^{-19} \text{ C})(25.0 \text{ V})}{9.11 \times 10^{-31} \text{ kg}}} = 2.96 \times 10^6 \text{ m/s}. \)

Evaluate: Typical voltages in student laboratory work run up to around 25 V, so typical reasonable values for the charge on the plates is about 40 pC and a reasonable value for the electric field is about 5000 V/m, as we found here. The electron speed would be about 3 million m/s.

23.67. (a) Identify and set up: Problem 23.63 derived that \( E = V_{ab} \frac{1}{\ln(b/a) \cdot r} \), where \( a \) is the radius of the inner cylinder (wire) and \( b \) is the radius of the outer hollow cylinder. The potential difference between the two cylinders is \( V_{ab} \). Use this expression to calculate \( E \) at the specified \( r \).

Execute: Midway between the wire and the cylinder wall is at a radius of \( r = (a+b)/2 = (90.0 \times 10^{-6} \text{ m} + 0.140 \text{ m})/2 = 0.07004 \text{ m}. \)

\[ E = \frac{V_{ab}}{\ln(b/a) \cdot r} = \frac{50.0 \times 10^3 \text{ V}}{\ln(0.140 \text{ m}/90.0 \times 10^{-6} \text{ m})(0.07004 \text{ m})} = 9.71 \times 10^4 \text{ V/m}. \]

(b) Identify and set up: The electric force is given by Eq. (21.3). Set this equal to ten times the weight of the particle and solve for \( |q| \), the magnitude of the charge on the particle.

Execute: \( F = 10mg \)

\[ |q| E = 10mg \quad \text{and} \quad |q| = \frac{10mg}{E} = \frac{10(30.0 \times 10^{-3} \text{ kg})(9.80 \text{ m/s}^2)}{9.71 \times 10^4 \text{ V/m}} = 3.03 \times 10^{-11} \text{ C}. \]

Evaluate: It requires only this modest net charge for the electric force to be much larger than the weight.

23.68. (a) Identify: Calculate the potential due to each thin ring and integrate over the disk to find the potential. \( V \) is a scalar so no components are involved.

Set up: Consider a thin ring of radius \( y \) and width \( dy \). The ring has area \( 2\pi y dy \) so the charge on the ring is \( dq = \sigma(2\pi y dy) \).
Electric Potential

EXECUTE: The result of Example 23.11 then says that the potential due to this thin ring at the point on the axis at a distance \( x \) from the ring is

\[
dV = \frac{1}{4\pi \varepsilon_0} \frac{dq}{\sqrt{x^2 + y^2}} = \frac{2\pi \sigma}{4\pi \varepsilon_0} \frac{y \, dy}{\sqrt{x^2 + y^2}}
\]

\[
V = \int dV = \frac{\sigma}{2\varepsilon_0} \int_0^R \frac{y \, dy}{\sqrt{x^2 + y^2}} = \frac{\sigma}{2\varepsilon_0} \left[ \sqrt{x^2 + y^2} \right]_0^R = \frac{\sigma}{2\varepsilon_0} \left( \sqrt{x^2 + R^2} - x \right)
\]

EVALUATE: For \( x \gg R \), this result should reduce to the potential of a point charge with \( Q = \sigma \pi R^2 \).

\[
\sqrt{x^2 + R^2} = x(1 + R^2/x^2)^{1/2} = x(1 + R^2/2x^2) \quad \text{so} \quad \sqrt{x^2 + R^2} - x = R^2/2x
\]

Then \( V = \frac{\sigma R^2}{2\varepsilon_0} = \frac{\sigma \pi R^2}{4\pi \varepsilon_0} = \frac{Q}{2\pi \varepsilon_0 x} \), as expected.

(b) IDENTIFY and SET UP: Use Eq. (23.19) to calculate \( E_z \).

EXECUTE: \( E_z = \frac{\partial V}{\partial x} = -\frac{\sigma}{2\varepsilon_0} \left( \frac{x}{\sqrt{x^2 + R^2}} \right) - 1 \).

EVALUATE: Our result agrees with Eq. (21.11) in Example 21.11.

23.69. (a) IDENTIFY: Use \( V_a - V_b = \int_a^b \vec{E} \cdot d\vec{l} \).

SET UP: From Problem 22.42, \( E(r) = \frac{\lambda r}{2\pi \varepsilon_0 R^2} \) for \( r \leq R \) (inside the cylindrical charge distribution) and \( E(r) = \frac{\lambda}{2\pi \varepsilon_0 r} \) for \( r \geq R \). Let \( V = 0 \) at \( r = R \) (at the surface of the cylinder).

EXECUTE: \( r > R \)

Take point \( a \) to be at \( R \) and point \( b \) to be at \( r \), where \( r > R \). Let \( d\vec{l} = d\vec{r} \). \( \vec{E} \) and \( d\vec{r} \) are both radially outward, so \( \vec{E} \cdot d\vec{r} = E \, dr \). Thus \( V_R - V_r = \int_R^r E \, dr \). Then \( V_R = 0 \) gives \( V_r = -\int_R^r E \, dr \). In this interval \( (r > R) \), \( E(r) = \lambda/2\pi \varepsilon_0 r \), so

\[
V_r = -\int_R^r \frac{\lambda}{2\pi \varepsilon_0 r} \, dr = -\frac{\lambda}{2\pi \varepsilon_0} \ln \left( \frac{r}{R} \right).
\]

EVALUATE: This expression gives \( V_r = 0 \) when \( r = R \) and the potential decreases (becomes a negative number of larger magnitude) with increasing distance from the cylinder.

EXECUTE: \( r < R \)

Take point \( a \) at \( r \), where \( r < R \), and point \( b \) at \( R \). \( \vec{E} \cdot d\vec{r} = E \, dr \) as before. Thus \( V_R - V_r = \int_r^R E \, dr \). Then \( V_R = 0 \) gives \( V_r = \int_r^R E \, dr \). In this interval \( (r < R) \), \( E(r) = \lambda r/2\pi \varepsilon_0 R^2 \), so

\[
V_r = \int_r^R \frac{\lambda r}{2\pi \varepsilon_0 R^2} \, dr = \frac{\lambda}{2\pi \varepsilon_0} \int_r^R r \, dr = \frac{\lambda}{2\pi \varepsilon_0 R} \left( \frac{R^2 - r^2}{2} \right).
\]

EVALUATE: This expression also gives \( V_r = 0 \) when \( r = R \). The potential is \( \lambda/4\pi \varepsilon_0 \) at \( r = 0 \) and decreases with increasing \( r \).

(b) EXECUTE: Graphs of \( V \) and \( E \) as functions of \( r \) are sketched in Figure 23.69.

Figure 23.69

**EVALUATE:** $E$ at any $r$ is the negative of the slope of $V(r)$ at that $r$ (Eq. 23.23).

**23.70. IDENTIFY:** Divide the rod into infinitesimal segments with charge $dq$. The potential $dV$ due to the segment is $dV = \frac{1}{4\pi\varepsilon_0} \frac{dq}{r}$. Integrate over the rod to find the total potential.

**SET UP:** $dq = \lambda dl$, with $\lambda = Q/\pi a$ and $dl = a d\theta$.

**EXECUTE:**

$$dV = \frac{1}{4\pi\varepsilon_0} \frac{dq}{r} = \frac{1}{4\pi\varepsilon_0} \frac{\lambda dl}{a} = \frac{1}{4\pi\varepsilon_0} \frac{Q d\theta}{\pi a}$$

$$V = \frac{1}{4\pi\varepsilon_0} \int_0^\pi \frac{Q d\theta}{\pi a} = \frac{Q}{4\pi\varepsilon_0 a}$$

**EVALUATE:** All the charge of the ring is the same distance $a$ from the center of curvature.

**23.71. IDENTIFY:** We must integrate to find the total energy because the energy to bring in more charge depends on the charge already present.

**SET UP:** If $\rho$ is the uniform volume charge density, the charge of a spherical shell or radius $r$ and thickness $dr$ is $dq = \rho 4\pi r^2 dr$, and $\rho = Q/(4/3 \pi R^3)$. The charge already present in a sphere of radius $r$ is $q = \rho(4/3 \pi r^3)$. The energy to bring the charge $dq$ to the surface of the charge $q$ is $V dq$, where $V$ is the potential due to $q$, which is $q/(4\pi\varepsilon_0 r)$.

**EXECUTE:** The total energy to assemble the entire sphere of radius $R$ and charge $Q$ is sum (integral) of the tiny increments of energy.

$$U = \int_0^Q V dq = \frac{Q^2}{4\pi\varepsilon_0 R} = \int_0^R \frac{Q^2}{4\pi\varepsilon_0 r^2} (\rho 4\pi r^2 dr) = \frac{3}{5} \left( \frac{1}{4\pi\varepsilon_0} \frac{Q^2}{R} \right)$$

where we have substituted $\rho = Q/(4/3 \pi R^3)$ and simplified the result.

**EVALUATE:** For a point charge, $R \to 0$ so $U \to \infty$, which means that a point charge should have infinite self-energy. This suggests that either point charges are impossible, or that our present treatment of physics is not adequate at the extremely small scale, or both.

**23.72. IDENTIFY:** $V_a - V_b = \int_a^b \vec{E} \cdot d\vec{r}$. The electric field is radially outward, so $\vec{E} \cdot d\vec{r} = E \, dr$.

**SET UP:** Let $a = \infty$, so $V_a = 0$.

**EXECUTE:** From Example 22.9, we have the following. For $r > R$: $E = \frac{kQ}{r^2}$ and $V = -kQ \int_0^r \frac{dr'}{r'^2} = \frac{kQ}{r}$.

For $r < R$: $E = \frac{kQ}{r^3}$ and

$$V = -\int_{-R}^0 \vec{E} \cdot d\vec{r}' - \int_R^0 \vec{E} \cdot d\vec{r}' = \frac{kQ}{R} \frac{kQ}{R^3} \int_0^r \frac{r'}{r'^2} dr' = \frac{kQ}{R} \left[ \frac{kQ}{R} \frac{1}{2} \right] r \bigg|_R^{2R} + \frac{kQ}{2R} \frac{kQ r^2}{2R^3} + \frac{kQ}{2R} \left[ \frac{3}{2} \frac{r^2}{R} \right].$$

(b) The graphs of $V$ and $E$ versus $r$ are sketched in Figure 23.72.
23.73. **IDENTIFY:** The sphere no longer behaves as a point charge because we are inside of it. We know how the electric field varies with distance from the center of the sphere and want to use this to find the potential difference between the center and surface, which requires integration.

**SET UP:** Use the result of Problem 23.72. For \( r < R \), \( V = \frac{kQ}{2R} \left( 3 - \frac{r^2}{R^2} \right) \).

**EXECUTE:** At the center of the sphere, \( r = 0 \) and \( V_1 = \frac{3kQ}{2R} \). At the surface of the sphere, \( r = R \) and

\[
V_2 = \frac{kQ}{R}.
\]

The potential difference is \( V_1 - V_2 = \frac{kQ}{2R} \left( \frac{8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2 \cdot (4.00 \times 10^{-6} \text{ C})}{(2(0.0500 \text{ m}))} \right) = 3.60 \times 10^5 \text{ V}.
\]

**EVALUATE:** To check our answer, we could actually do the integration. We can use the fact that \( E = \frac{kQ}{R^2} \) so \( V_1 - V_2 = \int_0^R \frac{kQ}{R^2} r dr = \frac{kQ}{R} \left( \frac{R^2}{2} \right) = \frac{kQ}{2R} \).

23.74. **IDENTIFY:** For \( r < c \), \( E = 0 \) and the potential is constant. For \( r > c \), \( E \) is the same as for a point charge and \( V = \frac{kq}{r} \).

**SET UP:** \( V_\infty = 0 \)

**EXECUTE:** (a) Points \( a, b \) and \( c \) are all at the same potential, so \( V_a - V_b = V_b - V_c = V_a - V_c = 0 \).

\[
V_c - V_\infty = \frac{kg}{R} = \frac{(8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2 \cdot (150 \times 10^{-6} \text{ C})}{0.60 \text{ m}} = 2.25 \times 10^6 \text{ V}
\]

(b) They are all at the same potential.

(c) Only \( V_c - V_\infty \) would change; it would be \(-2.25 \times 10^6 \text{ V}\).

**EVALUATE:** The voltmeter reads the potential difference between the two points to which it is connected.

23.75. **IDENTIFY** and **SET UP:** Apply \( F_r = -dU/dr \) and Newton’s third law.

**EXECUTE:** (a) The electrical potential energy for a spherical shell with uniform surface charge density and a point charge \( q \) outside the shell is the same as if the shell is replaced by a point charge at its center. Since \( F_r = -dU/dr \), this means the force the shell exerts on the point charge is the same as if the shell were replaced by a point charge at its center. But by Newton’s third law, the force \( q \) exerts on the shell is the same as if the shell were a point charge. But \( q \) can be replaced by a spherical shell with uniform surface charge and the force is the same, so the force between the shells is the same as if they were both replaced by point charges at their centers. And since the force is the same as for point charges, the electrical potential energy for the pair of spheres is the same as for a pair of point charges.

(b) The potential for solid insulating spheres with uniform charge density is the same outside of the sphere as for a spherical shell, so the same result holds.
(c) The result doesn’t hold for conducting spheres or shells because when two charged conductors are brought close together, the forces between them cause the charges to redistribute and the charges are no longer distributed uniformly over the surfaces.

**EVALUATE:** For the insulating shells or spheres, \( F = k \frac{|q_1 q_2|}{r^2} \) and \( U = \frac{kq_1 q_2}{r} \), where \( q_1 \) and \( q_2 \) are the charges of the objects and \( r \) is the distance between their centers.

### 23.76.

**IDENTIFY:** Apply Newton’s second law to calculate the acceleration. Apply conservation of energy and conservation of momentum to the motions of the spheres.

**SET UP:** Problem 23.75 shows that \( F = k \frac{|q_1 q_2|}{r^2} \) and \( U = \frac{kq_1 q_2}{r} \), where \( q_1 \) and \( q_2 \) are the charges of the objects and \( r \) is the distance between their centers.

**EXECUTE:** Maximum speed occurs when the spheres are very far apart. Energy conservation gives
\[
\frac{kq_1 q_2}{r} = \frac{1}{2} m_{50} v_{50}^2 + \frac{1}{2} m_{150} v_{150}^2.
\]

Momentum conservation gives
\[
m_{50} v_{50} = m_{150} v_{150} \quad \text{and} \quad v_{50} = 3v_{150}.
\]

\( r = 0.50 \text{ m} \). Solve for \( v_{50} \) and \( v_{150} \): \( v_{50} = 12.7 \text{ m/s}, v_{150} = 4.24 \text{ m/s} \). Maximum acceleration occurs just after spheres are released. \( \Sigma F = ma \) gives
\[
\frac{kq_1 q_2}{r^2} = m_{150} a_{150}.
\]

\[
\frac{9 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2 (10^{-5} \text{ C})(3 \times 10^{-5} \text{ C})}{(0.50 \text{ m})^2} = (0.15 \text{ kg}) a_{150}, \quad a_{150} = 72.0 \text{ m/s}^2 \quad \text{and} \quad v_{150} = 3a_5 = 216 \text{ m/s}^2.
\]

**EVALUATE:** The more massive sphere has a smaller acceleration and a smaller final speed.

### 23.77.

**IDENTIFY:** Use Eq. (23.17) to calculate \( V_{ab} \).

**SET UP:** From Problem 22.45, for \( R \leq r \leq 2R \) (between the sphere and the shell) \( E = Q/4 \pi \varepsilon_0 r^2 \).
Take a at \( R \) and b at \( 2R \).

**EXECUTE:** \( V_{ab} = V_a - V_b = \int_R^{2R} E \, dr = \frac{Q}{4 \pi \varepsilon_0} \int_R^{2R} \frac{1}{r^2} \, dr = \frac{Q}{4 \pi \varepsilon_0} \left( \frac{1}{R} - \frac{1}{2R} \right) \)
\[
V_{ab} = \frac{Q}{8 \pi \varepsilon_0 R}
\]

**EVALUATE:** The electric field is radially outward and points in the direction of decreasing potential, so the sphere is at higher potential than the shell.

### 23.78.

**IDENTIFY:** \( V_a - V_b = \oint_a \hat{E} \cdot d\ell \)

**SET UP:** \( \hat{E} \) is radially outward, so \( \hat{E} \cdot d\ell = E \, dr \). Problem 22.44 shows that \( E(r) = 0 \) for \( r \leq a \), \( E(r) = kq/r^2 \) for \( a < r < b \), \( E(r) = 0 \) for \( b < r < c \) and \( E(r) = kq/r^2 \) for \( r > c \).

**EXECUTE:** (a) At \( r = c \): \( V_c = -\int_0^c \frac{kq}{r^2} \, dr = \frac{kq}{c} \).

(b) At \( r = b \): \( V_b = -\int_0^b \frac{kq}{r^2} \, dr = \frac{kq}{c} - 0 = \frac{kq}{c} \).

(c) At \( r = a \): \( V_a = -\int_0^a \frac{kq}{r^2} \, dr - \int_c^{\infty} \hat{E} \cdot d\ell = \frac{kq}{c} - kq \int_b^a \frac{1}{r^2} \, dr = \frac{kq}{c} \left[ \frac{1}{c} - \frac{1}{b} + \frac{1}{a} \right] \).

(d) At \( r = 0 \): \( V_0 = kq \left[ \frac{1}{c} + \frac{1}{b} + \frac{1}{a} \right] \) since it is inside a metal sphere, and thus at the same potential as its surface.

**EVALUATE:** The potential difference between the two conductors is \( V_a - V_b = kq \left[ \frac{1}{a} - \frac{1}{b} \right] \).
23.79. **IDENTIFY:** Slice the rod into thin slices and use Eq. (23.14) to calculate the potential due to each slice. Integrate over the length of the rod to find the total potential at each point.

(a) **SET UP:** An infinitesimal slice of the rod and its distance from point \( P \) are shown in Figure 23.79a.

![Figure 23.79a](image)

Use coordinates with the origin at the left-hand end of the rod and one axis along the rod. Call the axes \( x' \) and \( y' \) so as not to confuse them with the distance \( x \) given in the problem.

**EXECUTE:** Slice the charged rod up into thin slices of width \( dx' \). Each slice has charge \( dQ = Q(dx'/a) \) and a distance \( r = x + a - x' \) from point \( P \). The potential at \( P \) due to the small slice \( dQ \) is

\[
dV = \frac{1}{4\pi\varepsilon_0} \left( \frac{dQ}{r} \right) = \frac{1}{4\pi\varepsilon_0} \frac{Q}{a} \left( \frac{dx'}{x + a - x'} \right)
\]

Compute the total \( V \) at \( P \) due to the entire rod by integrating \( dV \) over the length of the rod (\( x' = 0 \) to \( x' = a \)):

\[
V = \int dV = \frac{Q}{4\pi\varepsilon_0 a} \int_0^a \frac{dx'}{x + a - x'} = \frac{Q}{4\pi\varepsilon_0 a} \left[ -\ln(x + a - x') \right]_0^a = \frac{Q}{4\pi\varepsilon_0 a} \ln \left( \frac{x + a}{x} \right).
\]

**EVALUATE:** As \( x \to \infty \), \( V \to \frac{Q}{4\pi\varepsilon_0 a} \ln \left( \frac{x}{x} \right) = 0 \).

(b) **SET UP:** An infinitesimal slice of the rod and its distance from point \( R \) are shown in Figure 23.79b.

![Figure 23.79b](image)

\( dQ = (Q/a)dx' \) as in part (a)

Each slice \( dQ \) is a distance \( r = \sqrt{y^2 + (a - x')^2} \) from point \( R \).

**EXECUTE:** The potential \( dV \) at \( R \) due to the small slice \( dQ \) is

\[
dV = \frac{1}{4\pi\varepsilon_0} \left( \frac{dQ}{r} \right) = \frac{1}{4\pi\varepsilon_0} \frac{Q}{a} \frac{dx'}{\sqrt{y^2 + (a - x')^2}}.
\]

\[
V = \int dV = \frac{Q}{4\pi\varepsilon_0 a} \int_0^a \frac{dx'}{\sqrt{y^2 + (a - x')^2}}.
\]
In the integral make the change of variable \( u = x - A; \, du = -dx \)

\[
V' = -\frac{Q}{4\pi\varepsilon_0\alpha} \int_0^\infty \frac{du}{\sqrt{y^2 + u^2}} = -\frac{Q}{4\pi\varepsilon_0\alpha} \left[ \ln(u + \sqrt{y^2 + u^2}) \right]_0^\infty.
\]

\[
V' = -\frac{Q}{4\pi\varepsilon_0\alpha} \left[ \ln y - \ln \left( a + \sqrt{a^2 + y^2} \right) \right] = \frac{Q}{4\pi\varepsilon_0\alpha} \left[ \ln \left( \frac{a + \sqrt{a^2 + y^2}}{y} \right) \right].
\]

(The expression for the integral was found in Appendix B.)

**Evaluate:** As \( y \to \infty, \, V \to \frac{Q}{4\pi\varepsilon_0\alpha} \ln \left( \frac{y}{y} \right) = 0.\)

**Set Up:**

\( \text{part (a): } V' = \frac{Q}{4\pi\varepsilon_0\alpha} \ln \left( \frac{x + a}{x} \right) = \frac{Q}{4\pi\varepsilon_0\alpha} \ln \left( 1 + \frac{a}{x} \right). \)

From Appendix B, \( \ln(1+u) = u - u^2/2 \ldots \), so \( \ln(1+a/x) = a/x - a^2/(2x^2) \) and this becomes \( a/x \) when \( x \) is large.

**Execute:** Thus \( V' \to \frac{Q}{4\pi\varepsilon_0\alpha} \left( \frac{a}{x} \right) = \frac{Q}{4\pi\varepsilon_0\alpha}. \) For large \( x \), \( V' \) becomes the potential of a point charge.

\( \text{part (b): } V' = -\frac{Q}{4\pi\varepsilon_0\alpha} \left[ \ln \left( \frac{a + \sqrt{a^2 + y^2}}{y} \right) \right] = \frac{Q}{4\pi\varepsilon_0\alpha} \ln \left( 1 + \frac{a^2}{y^2} \right). \)

From Appendix B, \( \sqrt{1+a^2/y^2} = (1+a^2/y^2)^{1/2} = 1+ a^2/2y^2 + \ldots \)
Thus \( a/y + \sqrt{1+a^2/y^2} \to 1 + a/y + a^2/(2y^2) + \ldots \to 1 + a/y. \) And then using \( \ln(1+u) = u \) gives

\[
V' \to -\frac{Q}{4\pi\varepsilon_0\alpha} \ln(1+a/y) \to \frac{Q}{4\pi\varepsilon_0\alpha} \left( \frac{a}{y} \right) = \frac{Q}{4\pi\varepsilon_0\alpha}.
\]

**Evaluate:** For large \( y \), \( V' \) becomes the potential of a point charge.

**23.80. Identify:** The potential at the surface of a uniformly charged sphere is \( V' = \frac{kQ}{R} \).

**Set Up:** For a sphere, \( V' = 4\pi\varepsilon_0 R^3 \). When the raindrops merge, the total charge and volume are conserved.

**Execute:**

\( (a) \) \( V' = \frac{kQ}{R} = \frac{k(-3.60 \times 10^{-12} \text{ C})}{6.50 \times 10^{-4} \text{ m}} = -49.8 \text{ V}. \)

\( (b) \) The volume doubles, so the radius increases by the cube root of two: \( R_{\text{new}} = \sqrt[3]{2} R = 8.19 \times 10^{-4} \text{ m} \) and the new charge is \( Q_{\text{new}} = 2Q = -7.20 \times 10^{-12} \text{ C}. \) The new potential is

\[
V'_{\text{new}} = \frac{kQ_{\text{new}}}{R_{\text{new}}} = \frac{k(-7.20 \times 10^{-12} \text{ C})}{8.19 \times 10^{-4} \text{ m}} = -79.0 \text{ V}.
\]

**Evaluate:** The charge doubles but the radius also increases and the potential at the surface increases by only a factor of \( \frac{2^{2/3}}{2} = 2^{2/3} = 1.6. \)

**23.81. (a) Identify and Set Up:** The potential at the surface of a charged conducting sphere is given by

Example 23.8: \( V' = \frac{1}{4\pi\varepsilon_0} \frac{q}{R}. \) For spheres \( A \) and \( B \) this gives

\[
V'_A = \frac{Q_A}{4\pi\varepsilon_0 R_A} \quad \text{and} \quad V'_B = \frac{Q_B}{4\pi\varepsilon_0 R_B}.
\]

© Copyright 2012 Pearson Education, Inc. All rights reserved. This material is protected under all copyright laws as they currently exist. No portion of this material may be reproduced, in any form or by any means, without permission in writing from the publisher.
**EXECUTE:**  \( V_A = V_B \) gives \( Q_A / 4 \pi \epsilon_0 R_A = Q_B / 4 \pi \epsilon_0 R_B \) and \( Q_B / Q_A = R_B / R_A \). And then \( R_A = 3 R_B \) implies \( Q_B / Q_A = 1/3 \).

**(b) IDENTIFY and SET UP:** The electric field at the surface of a charged conducting sphere is given in Example 22.5:

\[
E = \frac{1}{4 \pi \epsilon_0} \frac{|q|}{R^2}.
\]

**EXECUTE:** For spheres \( A \) and \( B \) this gives

\[
E_A = \frac{|Q_A|}{4 \pi \epsilon_0 R_A^2} \quad \text{and} \quad E_B = \frac{|Q_B|}{4 \pi \epsilon_0 R_B^2}.
\]

\[
\frac{E_B}{E_A} = \left( \frac{|Q_B|}{|Q_A|} \right) \left( \frac{4 \pi \epsilon_0 R_A^2}{4 \pi \epsilon_0 R_B^2} \right) = \left( \frac{Q_B}{Q_A} \right) \left( \frac{R_A}{R_B} \right)^2 = \left( \frac{1}{3} \right)^2 = 3.
\]

**EVALUATE:** The sphere with the larger radius needs more net charge to produce the same potential. We can write \( E = k R \) for a sphere, so with equal potentials the sphere with the smaller \( R \) has the larger \( E \).

**23.82. IDENTIFY:** Apply conservation of energy, \( K_a + U_a = K_b + U_b \).

**SET UP:** Assume the particles initially are far apart, so \( U_a = 0 \). The alpha particle has zero speed at the distance of closest approach, so \( K_b = 0 \). \( 1 \) eV = \( 1.60 \times 10^{-19} \) J. The alpha particle has charge \( +2e \) and the lead nucleus has charge \(-82e\).

**EXECUTE:** Set the alpha particle’s kinetic energy equal to its potential energy: \( K_a = U_b \) gives

\[
11.0 \text{ MeV} = \frac{k(2e)(82e)}{r} \quad \text{and} \quad r = \frac{k(164)(1.60 \times 10^{-19} \text{ C})^2}{(11.0 \times 10^{-6} \text{ eV})(1.60 \times 10^{-19} \text{ J/eV})} = 2.15 \times 10^{-14} \text{ m}.
\]

**EVALUATE:** The calculation assumes that at the distance of closest approach the alpha particle is outside the radius of the lead nucleus.

**23.83. IDENTIFY and SET UP:** The potential at the surface is given by Example 23.8 and the electric field at the surface is given by Example 22.5. The charge initially on sphere 1 spreads between the two spheres such as to bring them to the same potential.

**EXECUTE:**

(a) \( E_1 = \frac{1}{4 \pi \epsilon_0} \frac{Q_1}{R_1^2} \), \( V_1 = \frac{1}{4 \pi \epsilon_0} \frac{Q_1}{R_1} = R_1 E_1 \)

(b) Two conditions must be met:

1) Let \( q_1 \) and \( q_2 \) be the final charges of each sphere. Then \( q_1 + q_2 = Q_1 \) (charge conservation)

2) Let \( V_1 \) and \( V_2 \) be the final potentials of each sphere. All points of a conductor are at the same potential, so \( V_1 = V_2 \).

\( V_1 = V_2 \) requires that

\[
\frac{1}{4 \pi \epsilon_0} \frac{q_1}{R_1} = \frac{1}{4 \pi \epsilon_0} \frac{q_2}{R_2} \quad \text{and then} \quad q_1 R_1 = q_2 R_2
\]

\[
q_1 R_1 = q_2 R_2 = (Q_1 - q_1) R_1
\]

This gives \( q_1 = (R_1 / R_1 + R_2) Q_1 \) and \( q_2 = Q_1 - q_1 = Q_1 (1 - R_1 / (R_1 + R_2)) = Q_1 (R_2 / (R_1 + R_2)) \).

(c) \( V_1 = \frac{1}{4 \pi \epsilon_0} \frac{Q_1}{R_1} \) and \( V_2 = \frac{1}{4 \pi \epsilon_0} \frac{Q_2}{R_2} = \frac{Q_1}{4 \pi \epsilon_0 (R_1 + R_2)} \), which equals \( V_1 \) as it should.

(d) \( E_1 = \frac{V_1}{R_1} = \frac{Q_1}{4 \pi \epsilon_0 R_1 (R_1 + R_2)} \), \( E_2 = \frac{V_2}{R_2} = \frac{Q_1}{4 \pi \epsilon_0 R_2 (R_1 + R_2)} \).

**EVALUATE:** Part (a) says \( q_2 = q_1 (R_2 / R_1) \). The sphere with the larger radius needs more charge to produce the same potential at its surface. When \( R_1 = R_2 \), \( q_1 = q_2 = Q_1 / 2 \). The sphere with the larger radius has the smaller electric field at its surface.
23.84. IDENTIFY: Apply \( V_a - V_b = \int_a^b \vec{E} \cdot d\vec{a} \).

SET UP: From Problem 22.65, for \( r \geq R \), \( E = \frac{kQ}{r^2} \). For \( r \leq R \), \( E = \frac{kQ}{r^2} \left[ \frac{4r^3}{R^3} \right. - \frac{3r^4}{R^4} \].

EXECUTE: (a) \( r \geq R \): \( E = \frac{kQ}{r^2} \Rightarrow V = -\int_{r}^{\infty} \frac{kQ}{r^2} dr' = \frac{kQ}{r} \), which is the potential of a point charge.

(b) \( r \leq R \): \( E = \frac{kQ}{r^2} \left[ \frac{4r^3}{R^3} - \frac{3r^4}{R^4} \right] \) and 
\[
V = -\int_{r}^{R} \frac{kQ}{r^2} dr' - \int_{R}^{\infty} \frac{kQ}{R^2} \left[ 1 - \frac{r^2}{R^2} + \frac{2r^2}{R^2} + \frac{3r^3}{R^3} \right] = \frac{kQ}{R} \left[ \frac{r^3}{R^3} - \frac{2r^2}{R^2} + \frac{7}{2} \right]
\]

EVALUATE: At \( r = R \), \( V = \frac{kQ}{R} \). At \( r = 0 \), \( V = \frac{2kQ}{R} \). The electric field is radially outward and \( V \) increases as \( r \) decreases.

23.85. IDENTIFY: Apply conservation of energy: \( E_1 = E_2 \).

SET UP: In the collision the initial kinetic energy of the two particles is converted into potential energy at the distance of closest approach.

EXECUTE: (a) The two protons must approach to a distance of \( 2r_p \), where \( r_p \) is the radius of a proton.
\[
E_1 = E_2 \text{ gives } 2 \left[ \frac{1}{2} m_p v^2 \right] = \frac{kQ^2}{r_p} \quad \text{and} \quad v = \sqrt{\frac{kQ^2}{2m_p}} = 7.58 \times 10^5 \text{ m/s}.
\]

(b) For a helium-helium collision, the charges and masses change from (a) and
\[
v = \sqrt{\frac{kQ^2}{2m_p}} = 7.26 \times 10^5 \text{ m/s}.
\]

(c) \( K = \frac{3kT}{2} = m_p v^2 \quad \text{and} \quad T_p = \frac{m_p v^2}{3k} = \left( \frac{1.67 \times 10^{-27} \text{ kg}) (7.58 \times 10^5 \text{ m/s})^2}{3(1.38 \times 10^{-23} \text{ J/K})} \right) = 2.3 \times 10^9 \text{ K}.
\]

(d) These calculations were based on the particles’ average speed. The distribution of speeds ensures that there is always a certain percentage with a speed greater than the average speed, and these particles can undergo the necessary reactions in the sun’s core.

EVALUATE: The kinetic energies required for fusion correspond to very high temperatures.

23.86. IDENTIFY and SET UP: Apply Eq. (23.20). \( \frac{W_{a \to b}}{q_0} = V_a - V_b \) and \( V_a - V_b = \int_a^b \vec{E} \cdot d\vec{a} \).

EXECUTE: (a) \( \vec{E} = -\frac{\partial V}{\partial x}\hat{i} - \frac{\partial V}{\partial y}\hat{j} - \frac{\partial V}{\partial z}\hat{k} = -2\alpha x\hat{i} + 6\alpha y\hat{j} - 2\alpha z\hat{k} \)

(b) A charge is moved in along the z-axis. The work done is given by
\[
W = q \int_{z_0}^{z} \vec{E} \cdot d\vec{z} = q \int_{z_0}^{z} (-2.4\alpha z)dz = -(Aq)z_0^2. \quad \text{Therefore,} \quad A = \frac{W_{a \to b}}{q_0^2} = \frac{6.00 \times 10^{-5} \text{ J}}{(1.5 \times 10^{-6} \text{ C})(0.250 \text{ m})^2} = 640 \text{ V/m}^2.
\]

(c) \( \vec{E}(0,0,0.250) = -2(640 \text{ V/m}^2)(0.250 \text{ m})\hat{k} = -(320 \text{ V/m})\hat{k} \)

(d) In every plane parallel to the \( xy \)-plane, \( y \) is constant, so \( V(x,y,z) = \alpha x^2 + \alpha z^2 - C \), where \( C = 3\alpha y^2 \).
\[
\alpha x^2 + \alpha z^2 = \frac{V + C}{\alpha} = R^2, \quad \text{which is the equation for a circle since} \ R \text{ is constant as long as we have constant potential on those planes.} \]
(e) \( V = 1280 \text{ V} \) and \( y = 2.00 \text{ m} \), so \( x^2 + z^2 = \frac{1280 \text{ V} + 3(640 \text{ V/m}^2)(2.00 \text{ m})^2}{640 \text{ V/m}^2} = 14.0 \text{ m}^2 \) and the radius of the circle is \( 3.74 \text{ m} \).

**Evaluate:** In any plane parallel to the \( xz \)-plane, \( \vec{E} \) projected onto the plane is radial and hence perpendicular to the equipotential circles.

**23.87.** **Identify:** Apply conservation of energy to the motion of the daughter nuclei.

**Set Up:** Problem 23.72 shows that the electrical potential energy of the two nuclei is the same as if all their charge was concentrated at their centers.

**Execute:** (a) The two daughter nuclei have half the volume of the original uranium nucleus, so their radii are smaller by a factor of the cube root of 2: \( r = \frac{7.4 \times 10^{-15} \text{ m}}{\sqrt{2}} = 5.9 \times 10^{-15} \text{ m} \).

(b) \( U = \frac{k(46e_0)^2}{2r} = \frac{k(46)^2(1.60 \times 10^{-19} \text{ C})^2}{1.18 \times 10^{-14} \text{ m}} = 4.14 \times 10^{-11} \text{ J} \). \( U = 2K \), where \( K \) is the final kinetic energy of each nucleus. \( K = U/2 = (4.14 \times 10^{-11} \text{ J})/2 = 2.07 \times 10^{-11} \text{ J} \).

(c) If we have 10.0 kg of uranium, then the number of nuclei is \( n = \frac{10.0 \text{ kg}}{(236 \text{ u})(1.66 \times 10^{-27} \text{ kg/u})} = 2.55 \times 10^{25} \) nuclei. And each releases energy \( U \), so \( E = nU = (2.55 \times 10^{25})(4.14 \times 10^{-11} \text{ J}) = 1.06 \times 10^{15} \text{ J} = 253 \text{ kilotons of TNT} \).

(d) We could call an atomic bomb an “electric” bomb since the electric potential energy provides the kinetic energy of the particles.

**Evaluate:** This simple model considers only the electrical force between the daughter nuclei and neglects the nuclear force.

**23.88.** **Identify** and **Set Up:** In part (a) apply \( E = -\frac{\partial V}{\partial r} \). In part (b) apply Gauss’s law.

**Execute:** (a) For \( r \leq a \), \( E = -\frac{\partial V}{\partial r} = - \frac{\rho_0 a^2}{18e_0} \left[ -6r + 6 \frac{r^2}{a^2} \right] = \frac{\rho_0 a}{3e_0} \left[ \frac{r}{a} - \frac{r^2}{a^2} \right] \). For \( r \geq a \), \( E = -\frac{\partial V}{\partial r} = 0 \).

\( \vec{E} \) has only a radial component because \( V \) depends only on \( r \).

(b) For \( r \leq a \), Gauss’s law gives \( E_r 4\pi r^2 = \frac{Q_r}{e_0} = \frac{\rho_0 a}{3e_0} \left[ \frac{r}{a} - \frac{r^2}{a^2} \right] 4\pi r^2 \) and

\( E_{r+dr} 4\pi (r^2 + 2rdr) = \frac{Q_{r+dr}}{e_0} = \frac{\rho_0 a}{3e_0} \left[ \frac{r + dr}{a} - \frac{(r^2 + 2rdr)}{a^2} \right] 4\pi (r^2 + 2rdr) \). Therefore,

\( \frac{Q_{r+dr} - Q_r}{e_0} = \rho(r) 4\pi r^2 dr = \frac{\rho_0 a 4\pi r^2 dr}{3e_0} \left[ -\frac{2r}{a^2} + \frac{2}{a} + \frac{1}{a} \right] \) and \( \rho(r) = \frac{\rho_0}{3} \left[ 3 - \frac{4r}{a} \right] = \rho_0 \left[ 1 - \frac{4r}{3a} \right] \).

(c) For \( r \geq a \), \( \rho(r) = 0 \), so the total charge enclosed will be given by \( Q = 4\pi \int_0^a \rho(r) r^2 dr = 4\pi \rho_0 \int_0^a r^2 \left[ \frac{4r^3}{3a} \right] dr = 4\pi \rho_0 \left[ \frac{1}{3} \right] = 4\pi \rho_0 \left[ \frac{1}{3} \right] = 0 \).

**Evaluate:** Apply Gauss’s law to a sphere of radius \( r > R \). The result of part (c) says that \( Q_{\text{enc}} = 0 \), so \( E = 0 \). This agrees with the result we calculated in part (a).

**23.89.** **Identify:** Angular momentum and energy must be conserved.

**Set Up:** At the distance of closest approach the speed is not zero. \( E = K + U \). \( q_1 = 2e \), \( q_2 = 82e \).

**Execute:** \( mv_1b = mv_2r_2 \). \( E_1 = E_2 \) gives \( E_1 = \frac{1}{2} mv_2^2 + \frac{kq_1q_2}{r_2} \). \( E_1 = 11 \text{ MeV} = 1.76 \times 10^{-12} \text{ J} \). \( r_2 \) is the distance of closest approach. Substituting in for \( v_2 = v_1 \left( \frac{b}{r_2} \right) \) we find \( E_1 = E_1 \frac{b^2}{r_2^2} + \frac{kq_1q_2}{r_2} \).
Chapter 23

\[ (E_1)r_1^2 - (kq_1q_2)r_2 - E_2b^2 = 0. \] For \( b = 10^{-12} \text{ m} \), \( r_2 = 1.01 \times 10^{-12} \text{ m} \). For \( b = 10^{-13} \text{ m} \), \( r_2 = 1.11 \times 10^{-13} \text{ m} \). And for \( b = 10^{-14} \text{ m} \), \( r_2 = 2.54 \times 10^{-14} \text{ m} \).

**Evaluate:** As \( b \) decreases the collision is closer to being head-on and the distance of closest approach decreases. Problem 23.82 shows that the distance of closest approach is \( 2.15 \times 10^{-14} \text{ m} \) when \( b = 0 \).

### 23.90.

**Identify:** Consider the potential due to an infinitesimal slice of the cylinder and integrate over the length of the cylinder to find the total potential. The electric field is along the axis of the tube and is given by

\[ E = -\frac{\partial V}{\partial x}. \]

**Set Up:** Use the expression from Example 23.11 for the potential due to each infinitesimal slice. Let the slice be at coordinate \( z \) along the \( x \)-axis, relative to the center of the tube.

**Execute:** (a) For an infinitesimal slice of the finite cylinder, we have the potential

\[ dV = \frac{kQ}{L} \ln \left[ \frac{\sqrt{(x-z)^2 + R^2}}{(x-z)^2 + R^2} \right]. \]

Integrating gives

\[ V = \frac{kQ}{L} \ln \left[ \frac{\sqrt{(L/2 - x)^2 + R^2} + (L/2 - x)}{(L/2)^2 + R^2} \right] \]

on the cylinder axis.

(b) For \( L \ll R \),

\[ V = \frac{kQ}{L} \ln \left[ \frac{1 - xL/2R^2 + x^2}{1 + xL/2R^2 + x^2} \right] = \frac{kQ}{L} \ln \left[ \frac{1 - xL/2R^2 + x^2}{1 + xL/2R^2 + x^2} \right] \]

which is the same as for a ring.

\[ V = \frac{kQ}{2L} \frac{2L}{2x^2 + R^2} \]

(c) \( E_x = -\frac{\partial V}{\partial x} = \frac{2kQ}{(L-2x)^2 + 4R^2} \sqrt{(L+2x)^2 + 4R^2} \)

**Evaluate:** For \( L \ll R \) the expression for \( E_x \) reduces to that for a ring of charge, as given in Example 23.14.

### 23.91.

**Identify:** When the oil drop is at rest, the upward force \( |q|E \) from the electric field equals the downward weight of the drop. When the drop is falling at its terminal speed, the upward viscous force equals the downward weight of the drop.

**Set Up:** The volume of the drop is related to its radius \( r \) by \( V = \frac{4}{3} \pi r^3 \).

**Execute:** (a) \( F_g = mg = \frac{4}{3} \pi r^3 \rho g \), \( F_e = |q|E = |q|V_{AB} \). \( F_e = F_g \) gives \( |q| = \frac{4}{3} \pi \rho r^3 \frac{gd}{V_{AB}} \).

(b) \( \frac{4}{3} \pi \rho g = 6 \pi \rho r \) gives \( r = \frac{9 \pi \rho}{2 \rho g} \). Using this result to replace \( r \) in the expression in part (a) gives

\[ |q| = \frac{4}{3} \pi \rho g \left( \frac{9 \pi \rho}{2 \rho g} \right)^\frac{3}{2} \]

\[ \frac{d}{V_{AB}} \frac{3}{2} \frac{\pi \rho}{2 \rho g} \]

\[ = \frac{18}{V_{AB} \sqrt{\frac{3}{2} \frac{\pi \rho}{2 \rho g}}} \]

(c) \[ q = 18\pi \left( \frac{10^{-3} \text{ m}}{9.16 \text{ V}} \right) \sqrt{\frac{(1.81 \times 10^{-5} \text{ N} \cdot \text{s/m}^2)^2 (1.00 \times 10^{-3} \text{ m/39.3 s}^2)^3}{2(824 \text{ kg/m}^3)(9.80 \text{ m/s}^2)}} = 4.80 \times 10^{-19} \text{ C} = 3e. \] The drop has acquired three excess electrons.

\[ r = \sqrt{\frac{9(1.81 \times 10^{-5} \text{ N} \cdot \text{s/m}^2)(1.00 \times 10^{-3} \text{ m/39.3 s}^2)}{2(824 \text{ kg/m}^3)(9.80 \text{ m/s}^2)}} = 5.07 \times 10^{-7} \text{ m} = 0.507 \mu\text{m}. \]

**EVALUATE:** The weight of the drop is \( \left( \frac{4\pi r^3}{3} \right) \rho g = 4.4 \times 10^{-15} \text{ N}. \) The density of air at room temperature is 1.2 kg/m³, so the buoyancy force is \( \rho_{\text{air}} V g = 6.4 \times 10^{-18} \text{ N} \) and can be neglected.

23.92. **IDENTIFY:** \( v_{\text{cm}} = \frac{m_1 v_1 + m_2 v_2}{m_1 + m_2} \)

**SET UP:** \( E = K_1 + K_2 + U \), where \( U = \frac{kq_1 q_2}{r} \).

**EXECUTE:** (a) \( v_{\text{cm}} = \frac{(6 \times 10^{-5} \text{ kg})(400 \text{ m/s}) + (3 \times 10^{-5} \text{ kg})(1300 \text{ m/s})}{6.0 \times 10^{-5} \text{ kg} + 3.0 \times 10^{-5} \text{ kg}} = 700 \text{ m/s} \)

(b) \( E_{\text{rel}} = \frac{1}{2} m_1 v_1^2 + \frac{1}{2} m_2 v_2^2 + \frac{kq_1 q_2}{r} - \frac{1}{2} (m_1 + m_2) v_{\text{cm}}^2 \) After expanding the center of mass velocity and collecting like terms \( E_{\text{rel}} = \frac{1}{2} \left( \frac{m_1 m_2}{m_1 + m_2} \right) [v_1^2 + v_2^2 - 2v_1 v_2] + \frac{kq_1 q_2}{r} = \frac{1}{2} \mu (v_1 - v_2)^2 + \frac{kq_1 q_2}{r} \)

(c) \( E_{\text{rel}} = \frac{1}{2}(2.0 \times 10^{-5} \text{ kg})(900 \text{ m/s})^2 + \frac{k(2.0 \times 10^{-6} \text{ C})(-5.0 \times 10^{-6} \text{ C})}{0.0090 \text{ m}} = -1.9 \text{ J} \)

(d) Since the energy is less than zero, the system is “bound.”

(e) The maximum separation is when the velocity is zero: \( -1.9 \text{ J} = \frac{kq_1 q_2}{r} \) gives \( r = \frac{k(2.0 \times 10^{-6} \text{ C})(-5.0 \times 10^{-6} \text{ C})}{-1.9 \text{ J}} = 0.047 \text{ m}. \)

(f) Now using \( v_1 = 400 \text{ m/s}, \) and \( v_2 = 1800 \text{ m/s}, \) we find \( E_{\text{rel}} = +9.6 \text{ J}. \) The particles do escape, and the final relative velocity is \( |v_1 - v_2| = \sqrt{\frac{2E_{\text{rel}}}{\mu}} = \sqrt{\frac{2(9.6 \text{ J})}{2.0 \times 10^{-5} \text{ kg}}} = 980 \text{ m/s}. \)

**EVALUATE:** For an isolated system the velocity of the center of mass is constant and the system must retain the kinetic energy associated with the motion of the center of mass.
